In this paper, the Hartree–Fock–Slater X-α equations [Sla51b, Sla72] are rederived by an independent method, with the prediction of a value $\alpha = 2/3$, instead of Slater's original $\alpha = 1$. The same factor was later rediscovered in independent work [KS65].

Page 91 of this paper introduces atomic units for *length* ($a_H = h^2/(4\pi^2 me^2)$, the radius of first Bohr orbit of hydrogen), *charge* (e, the electron charge), and *mass* (m, electron mass). From these are derived the *unit of action* ($h/(2\pi)$), the *unit of energy* (e^2/a, twice the ionization energy of hydrogen), and the *unit of time* ($1/(4\pi cR)$). The value R is the Rydberg constant. Atomic units have since been in wide use in quantum science, to avoid dependence of calculations on physical constants whose accuracy improves over time, but some are still known only to a few decimal digits.
