- describes FPIC, an implementation in ML of a programmable extension to a PIC-like [Ker82] language. The authors raise interesting points about the difficulty of doing this correctly in ML, and conclude that a more powerful base language (e.g., Haskell) might be more suitable. FPIC includes support for both PostScript and \LaTeX output. [Kin90]

URL <http://www.usenix.org/publications/library/proceedings/coots97/proebsting2.html>. The authors demonstrate that, because of the strongly-type nature of the Java Virtual Machine, it is possible to reverse-engineer Java byte codes back to quite readable correct Java source code, making it difficult to conceal Java source code by distributing only compiled byte

codes. This has significant ramifications for commercial software development in Java.
