## ltdirchk.dtx

### 1 L<sup>A</sup>T<sub>E</sub>X System Dependent Initialisations

This file implements the semi-automatic determination of various system dependent parts of the initialisation. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}<space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by `.` and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, T<sub>E</sub>X will try to load the expansion of `<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, `/`.

`\input@path` should expand to a list of such directories, each in a `{}` group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS T<sub>E</sub>X versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` `\@TeXversion` is now set automatically by the initialisation tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation

is left for information. L<sup>A</sup>T<sub>E</sub>X does not set this variable exactly, the automatic tests set it to:

2 for any version,  $v$ ,  $v < 3.0$

3 for any version,  $v$ ,  $3.0 \leq v \leq 3.14$

*undefined* otherwise.

However these values are accurate enough for L<sup>A</sup>T<sub>E</sub>X to take appropriate action for these old T<sub>E</sub>Xs.

If your T<sub>E</sub>X is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this<sup>1</sup>, L<sup>A</sup>T<sub>E</sub>X will not work around a bug in old T<sub>E</sub>X versions, and so error messages will appear in a very strange format, with `^^J` appearing instead of line breaks:

```
! LaTeX Error: \rubbish undefined.^^J^^JSee the LaTeX manual or LaTeX Companion
for explanation.^^JType H <return> for immediate help.
...
```

```
1.3 \renewcommand{\rubbish}
      {}
?
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
! LaTeX Error: \rubbish undefined.
```

See the LaTeX manual or LaTeX Companion for explanation.

Type H <return> for immediate help.

```
! .
...
```

```
1.3 \renewcommand{\rubbish}
      {}
?
```

Note that this has an extra line `! .` which does not appear in error messages that use the default settings with a current version of T<sub>E</sub>X, but this should not cause any confusion we hope.

## 2 Initialisation

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

### 2.1 INITEX

```
1 (*dircheck)
2 (*initex)
3 (initex)\ifnum\catcode'\{=1
4 (initex) \errmessage
5 (initex) {LaTeX must be made using an initex with no format preloaded}
```

---

<sup>1</sup>Actually if your T<sub>E</sub>X is really old, version 2, L<sup>A</sup>T<sub>E</sub>X can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

```

6 <initex>\fi
7 \catcode'\{=1
8 \catcode'\}=2

```

If Lua<sub>T</sub><sub>E</sub><sub>X</sub> is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of Lua<sub>T</sub><sub>E</sub><sub>X</sub> do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```

9 \ifx\directlua\undefined
10 \else
11 \ifx\luatexversion\undefined

```

Enable e-TeX/pdfTeX/Umath primitives with their natural names

```

12 \directlua{tex.enableprimitives("",%
13 tex.extraprimitives('etex', 'pdftex', 'umath'))}

```

In current formats enable primitives with unprefix names. the `latexrelease` guards allow the primitives to be defined with a `\luatex` prefix if older formats are specified.

```

14 </initex>
15 </dircheck>
16 (*initex, latexrelease)
17 (latexrelease)\ifx\directlua\undefined\else
18 (latexrelease)\IncludeInRelease{2015/10/01}{\luatexluafunction}
19 (latexrelease) {LuaTeX (prefixed names)}%
20 \directlua{tex.enableprimitives("",%
21 tex.extraprimitives("omega", "aleph", "luatex"))}
22 (latexrelease)\EndIncludeInRelease
23 (latexrelease)\IncludeInRelease{0000/00/00}{\luatexluafunction}
24 (latexrelease) {LuaTeX (prefixed names)}%
25 (latexrelease)\directlua{
26 (latexrelease) tex.enableprimitives(
27 (latexrelease) "luatex",
28 (latexrelease) tex.extraprimitives("core","omega", "aleph", "luatex")
29 (latexrelease) )
30 (latexrelease) local i
31 (latexrelease) local t = { }
32 (latexrelease) for _,i in pairs(tex.extraprimitives("luatex")) do
33 (latexrelease) if not string.match(i,"^U") then
34 (latexrelease) if not string.match(i, "^luatex") then
35 (latexrelease) table.insert(t,i)
36 (latexrelease) end

### 3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between `START` and `END` is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

```

START

#### 3.1 texsys.cfg

This file contains the site specific definitions of the four macros `\@currdir`, `\input@path`, `\filename@parse` and `\@TeXversion`.

As distributed it only contains comments, however this ‘empty’ file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You *are* allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir`      `\@currdir{filename}{space}` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by `.` and/or `{space}`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path`    If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, `TeX` will try to load the expansion of

`<dir>{filename}{space}`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, `/`. One exception to this rule is that the input path should *always* contain the empty directory `{}` as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a `{}` group.

`\filename@parse`    After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS `TeX` versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion`    You should not need to set this macro in `texsys.cfg`. `LaTeX` tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

### 3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
130 %\def\@currdir{./}
131 %\let\input@path\@undefined
```

### 3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
132 % \def\@currdir{./}
133 % \def\input@path{%
134 %   {/usr/local/lib/tex/inputs/distrib/}%
135 %   {/usr/local/lib/tex/inputs/contrib/}%
136 %   {/usr/local/lib/tex/inputs/local/}%
137 % }
```

### 3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
138 % \def\@currdir{./}
139 % \let\input@path\@undefined
```

### 3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
140 % \def\@currdir{./}
141 % \def\input@path{%
142 %   {c:/tex/inputs/distrib/}%
143 %   {c:/tex/inputs/contrib/}%
144 %   {c:/tex/inputs/local/}%
145 % }
```

### 3.6 VMS (DECUS T<sub>E</sub>X, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
146 % \def\@currdir{[]}
147 % \let\input@path\@undefined
```

### 3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
148 % \def\currdir{[]}  
149 % \def\input@path{%  
150 %   {tex_inputs:}%  
151 %   {SOMEDISK:[SOME.TEX.DIRECTORY]}%  
152 % }
```

### 3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
153 % \def\currdir{:}  
154 % \let\input@path\undefined
```

### 3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with `:`, and they should contain *no* spaces.

```
155 % \def\currdir{:}  
156 % \def\input@path{%  
157 %   {Hard-Disk:Applications:TeX:TeX-inputs:}%  
158 %   {Hard-Disk:Applications:TeX:My-inputs:}%  
159 % }
```

### 3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form `<area>name`. For maximum compatibility with macro sets, you want `name.ext` to be mapped to `<ext>name`. and `<area>name.ext` to be mapped to `<area.ext>name`. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. `<>name` is the desired ‘current directory’ syntax.

the following code would possibly work:

```
160 % \def\@dir#1#2 {%  
161 %   \@d@r{#1}#2..\@nil}  
162 % \def\@d@r#1#2.#3.#4\@nil{%  
163 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 }  
164 %  
165 % \def\currdir{\@dir{}}  
166 % \def\input@path{%  
167 %   {\@dir{area.one}}%  
168 %   {\@dir{area.two}}%  
169 % }  
END  
170 \immediate\closeout15
```

If `texsys.cfg` did exist, then input it.

```
171 \else
172 \typeout{** Using the existing texsys.cfg}
173 \closein15
174 \input texsys.cfg
175 \fi
176 \enddocstrip)
```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```
177 \dircheck\input texsys.cfg
```

## 4 Setting `\currdir`

`\currdir` This is a local definition of `\IfFileExists`. It tries to relocate `texsys.aux`. If `\IfFileExists` it succeeds, then the `\currdir` syntax has been determined. If all the tests fail then `\currdir` will be set to `\empty`, and `ltxcheck` will warn of this when it checks the format.

```
178 \begingroup
179 \count@ \time
180 \divide \count@ 60
181 \count2 = - \count@
182 \multiply \count2 60
183 \advance \count2 \time
```

`\today` The current date and time stamp.

```
184 \edef \today {%
185   \the \year / \two@digits { \the \month } / \two@digits { \the \day } : %
186   \two@digits { \the \count@ } : \two@digits { \the \count2 } }
```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```
187 \immediate \openout 15 = texsys.aux
188 \immediate \write 15 { \today ^^J }
189 \immediate \closeout 15 %
```

`#1` is the file to try, `#2` is what to do on success, `#3` on failure.

```
190 \def \IfFileExists #1#2#3 { %
191   \openin \@inputcheck #1 %
192   \ifeof \@inputcheck
193     #3 \relax
194   \else
195     \read \@inputcheck to \reserved@a
196     \ifx \reserved@a \today
197       \typeout { #1 found } #2 \relax
198     \else
199       \typeout { BAD: old file \reserved@a (should be \today) } %
200       #3 \relax
201     \fi
202   \fi
203   \closein \@inputcheck }
204 \endlinechar = -1
```

If `\@currdir` has not been pre-defined in `texsys.cfg` then test for UNIX, VMS and Oz- $\TeX$ -Mac. syntax.

```
205 \ifx\@currdir\@undefined
206 \IfFileExists{./texsys.aux}{\gdef\@currdir{.}}%
207 {\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%
208 {\IfFileExists{:texsys.aux}{\gdef\@currdir{:}}{}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces a format with no user-interaction. Later if the format is not suitable for the system, `texsys.cfg` may be edited and the format re-made.

```
209 \ifx\@currdir\@undefined
210 \global\let\@currdir\empty
211 \typeout{^^J^^J%
212     !! No syntax for the current directory could be found^^J%
213     }%
214 \fi
```

Otherwise `\@currdir` was defined in `texsys.cfg`. In this case check that the syntax specified works on this system. (In case a complete  $\LaTeX$  system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending `texsys.cfg` and try again.

```
215 \else
216 \IfFileExists{\@currdir texsys.aux}{-}{%
217 \edef\reserved@a{\errhelp{%
218 texsys.cfg specifies the current directory syntax to be^^J%
219 \meaning\@currdir^^J%
220 but this does not work on this system.^^J%
221 Remove texsys.cfg and restart.}}\reserved@a
222 \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@@end}
```

The version of `\@currdir` in `texsys.cfg` looks OK.

```
223 \fi

224 \immediate\closeout15 %
225 \endgroup

226 \typeout{^^J^^J%
227     \noexpand\@currdir set to:
228     \expandafter\strip@prefix\meaning\@currdir.^^J%
229     }
```

Stop here if the file is being used unstripped.

```
230 (*docstrip)
231 \relax\endinput
232 </docstrip)
```

## 5 Setting `\input@path`

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found to be very reliable. The first-time installer of  $\LaTeX 2_{\epsilon}$  can not be expected to have enough information to supply the correct information to the prompts. Now

the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through  $\text{\LaTeX} 2_{\epsilon}$ . This will check, amongst other things, whether `texsys.cfg` will need to be edited and the format remade.

```

```

## 6 Filename Parsing

```

\filename@parse Split a filename into its components.
242 \ifx\filename@parse\@undefined
243   \def\reserved@a{.}\ifx\@currdir\reserved@a

```

Search for the last ].

```
261 \def\filename@path#1]#2\{\%
262 \ifx\#2\%
263 \def\reserved@a{\filename@simple#1.\}\%
264 \else
265 \edef\filename@area{\filename@area#1}\%
266 \def\reserved@a{\filename@path#2\}\%
267 \fi
268 \reserved@a}
269 \else\def\reserved@a{:}\ifx\@currdir\reserved@a
```

\filename@parse was not specified in texsys.cfg, but \@currdir looks like Macintosh...

```
270 \typeout{^^JDefining Mac style filename parser.^^J}
271 \def\filename@parse#1{\%
272 \let\filename@area\@empty
273 \expandafter\filename@path#1:\}
```

Search for the last :.

```
274 \def\filename@path#1:#2\{\%
275 \ifx\#2\%
276 \def\reserved@a{\filename@simple#1.\}\%
277 \else
278 \edef\filename@area{\filename@area#1}\%
279 \def\reserved@a{\filename@path#2\}\%
280 \fi
281 \reserved@a}
282 \else
```

\filename@parse was not specified in texsys.cfg. So just make a simple parser that always sets \filename@area to empty.

```
283 \typeout{^^JDefining generic filename parser.^^J}
284 \def\filename@parse#1{\%
285 \let\filename@area\@empty
286 \expandafter\filename@simple#1.\}\%
287 \fi\fi\fi
```

\filename@simple is used by all three versions. Finally we can split off the extension.

```
288 \def\filename@simple#1.#2\{\%
289 \ifx\#2\%
290 \let\filename@ext\relax
291 \else
292 \edef\filename@ext{\filename@dot#2\}\%
293 \fi
294 \edef\filename@base{#1}\}
```

Remove a final dot, added earlier.

```
295 \def\filename@dot#1.\{#1}
296 \else
```

Otherwise, \filename@parse was specified in texsys.cfg.

```
297 \typeout{^^J^^J}
298 \noexpand\filename@parse was defined in texsys.cfg:^^J%
```

```

299   \expandafter\strip@prefix\meaning\filename@parse.^J%
300   }
301 \fi

```

## 7 $\TeX$ Versions

`\@TeXversion`  $\TeX$  versions older than than 3.141 require `\@TeXversion` to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg  $\TeX$ 3.14 would be detected as  $\TeX$ 3, but  $\LaTeX$  only needs to take account of  $\TeX$ 's older than 3, or between 3 and 3.14.

```

302 \ifx\@TeXversion\@undefined
303   \ifx\@undefined\inputlineno
304     \def\@TeXversion{2}
305   \else
306     {\catcode'\^^J=\active
307      \def\reserved@a#1#2\@@{\if#1\string^3\fi}
308      \edef\reserved@a{\expandafter\reserved@a\string^^J\@@}
309      \ifx\reserved@a\@empty\else\gdef\@TeXversion{3}\fi}
310   \fi
311 \fi
312 </dircheck>

```

## 8 `ltxcheck.tex`

After the format has been made, and `article.cls` moved with the other files to the 'standard input directory' as specified in `install.txt`, the format may be checked by running the file `ltxcheck.tex`.

# File b

## lplain.dtx

### 9 Plain T<sub>E</sub>X

L<sup>A</sup>T<sub>E</sub>X includes almost all of the functionality of Knuth's original 'Basic Macros' That is, the plain T<sub>E</sub>X format described in Appendix B of the T<sub>E</sub>XBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep    \magstephalf
\mathhexbox
\vglue      \vgl@
\hglue      \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L<sup>A</sup>T<sub>E</sub>X font definitions are done using NFSS2 so none of PLAIN's font definitions are in L<sup>A</sup>T<sub>E</sub>X.

L<sup>A</sup>T<sub>E</sub>X has its own tabbing environment, so PLAIN's is disabled.

L<sup>A</sup>T<sub>E</sub>X uses its own output routine, so most of the plain one was removed.

```
1 (*2kernel)
2 \catcode'\{=1 % left brace is begin-group character
3 \catcode'\}=2 % right brace is end-group character
4 \catcode'\$=3 % dollar sign is math shift
5 \catcode'\&=4 % ampersand is alignment tab
6 \catcode'\#=6 % hash mark is macro parameter character
7 \catcode'\^=7 % circumflex and uparrow are for superscripts
8 \catcode'\_ =8 % underline and downarrow are for subscripts
9 \catcode'\^I=10 % ascii tab is a blank space
10 \chardef\active=13 \catcode'\^=\active % tilde is active
11 \catcode'\^L=\active \def^L{\par}% ascii form-feed is \par
12 \message{catcodes,}
```

We had to define the `\catcodes` right away, before the message line, since `\message` uses the `{` and `}` characters. When INITEX (the T<sub>E</sub>X initializer) starts up, it has defined the following `\catcode` values:

```
\catcode'\^@=9 %  ascii null is ignored
\catcode'\^M=5 %  ascii return is end-line
\catcode'\ =0 %    backslash is TeX escape character
\catcode'\%=14 %  percent sign is comment character
\catcode'\ =10 %  ascii space is blank space
\catcode'\^?=15 %  ascii delete is invalid
\catcode'\A=11 ... \catcode'\Z=11 % uppercase letters
\catcode'\a=11 ... \catcode'\z=11 % lowercase letters
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do\ \do\\\do\{\do\}\do\$\do\&%
14 \do\#\do\^\do\_ \do\% \do\^}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by `,` which can be defined if you want to do something to every item in the list.

We make `@` signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

```
15 \catcode'@=11
```

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

```
\@ne Small constants are defined using \chardef.
\tw@ 16 \chardef\@ne=1
\thr@ 17 \chardef\tw@=2
\sixt@@n 18 \chardef\thr@@=3
\@cclv 19 \chardef\sixt@@n=16
      20 \chardef\@cclv=255

\@cclvi Constants above 255 defined using \mathchardef.
\@m 21 \mathchardef\@cclvi=256
\@M 22 \mathchardef\@m=1000

      24 \mathchardef\@MM=20000
```

Allocation of registers

Here are macros for the automatic allocation of `\count`, `\box`, `\dimen`, `\skip`, `\muskip`, and `\toks` registers, as well as `\read` and `\write` stream numbers, `\fam` codes, `\language` codes, and `\insert` numbers.

```
25 \message{registers,}
```

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

The following counters are reserved:

```
0 to 9 page numbering
10 count allocation
11 dimen allocation
12 skip allocation
13 muskip allocation
14 box allocation
15 toks allocation
16 read file allocation
17 write file allocation
18 math family allocation
19 language allocation
20 insert allocation
21 the most recently allocated number
22 constant -1
```

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, `\count 10` always contains the number of the highest-numbered counter that has been allocated, `\count 14` the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a `\count`, `\dimen`, `\skip`, and `\box` all with the same number; `\count 20` contains the lowest-numbered insert that has been allocated. Of course, `\box255` is reserved for `\output`; `\count255`, `\dimen255`, and `\skip255` can be used freely.

It is recommended that macro designers always use `\global` assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-`\global` assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```

26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...
36 \count20=255 % allocates insertions 254, 253, ...

```

```

\insc@unt The insertion counter and most recent allocation.
\allocationnumber 37 \countdef\insc@unt=20
38 \countdef\allocationnumber=21

\m@ne The constant -1.
39 \countdef\m@ne=22 \m@ne=-1

\wlog Write on log file (only)
40 \def\wlog{\immediate\write\m@ne}

\count@ Here are abbreviations for the names of scratch registers that don't need to be
\dimen@ allocated.
\dimen@i 41 \countdef\count@=255
\dimen@ii 42 \dimendef\dimen@=0
\skip@ 43 \dimendef\dimen@i=1 % global only
\toks@ 44 \dimendef\dimen@ii=2
45 \skipdef\skip@=0
46 \toksdef\toks@=0

\newcount Now, we define \newcount, \newbox, etc. so that you can say \newcount\foo and
\newdimen \foo will be defined (with \countdef) to be the next counter.
\newskip To find out which counter \foo is, you can look at \allocationnumber.
\newmuskip Since there's no \boxdef command, \chardef is used to define a \newbox,
\newbox \newinsert, \newfam, and so on.
\newread
\newwrite
\newlanguage File b: ltplain.dtx Date: 2017/04/10 Version v2.3c

```

L<sup>A</sup>T<sub>E</sub>X change: remove `\outer` from `\newcount` and `\newdimen` (FMi) This is necessary to use `\newcount` inside `\if...` later on. Also remove from `\newskip`, `\newbox` `\newwrite` and `\newfam` (DPC) to save later redefinition.

362 \def\rq{'}

\lbrack
\rbrack 363 \def\lbrack{[}
364 \def\rbrack{]}

\aa These are not from plain.tex but they are similar to other commands found here
\AA and nowhere else, being alternate input forms for characters.
365 \def \aa {\r a}
366 \def \AA {\r A}

```

```

\endgraf
\endline 367 \let\endgraf=\par
          368 \let\endline=\cr

\space
          369 \def\space{ }

\empty This probably ought to go altogether, but let it to the LATEX version to save space.
          370 \let\empty\@empty

\null
          371 \def\null{\hbox{}}

\bgroup
\egroup 372 \let\bgroup={
          373 \let\egroup=}

\obeylines In \obeylines, we say \let^^M=\par instead of \def^^M{\par} since this allows,
\obeyspaces for example, \let\par=\cr \obeylines \halign{...
          374 {\catcode'\^^M=\active % these lines must end with %
          375 \gdef\obeylines{\catcode'\^^M\active \let^^M\par}%
          376 \global\let^^M\par} % this is in case ^^M appears in a \write
          377 \def\obeyspaces{\catcode'\ \active}
          378 {\obeyspaces\global\let =\space}

\loop We use Kabelschacht's method of doing loops, see TUB 8#2 (1987). (unless that
\iterate breaks something :-). It turned out to need an extra \relax: see pr/642 (\loop
\repeat could do one iteration too much in certain cases).
          379 \long\def \loop #1\repeat{%
          380 \def\iterate{#1\relax % Extra \relax
          381 \expandafter\iterate\fi
          382 }%
          383 \iterate
          384 \let\iterate\relax
          385 }

This setting of \repeat is needed to make \loop...\if...\repeat skippable
within another \if....
          386 \let\repeat=\fi

LATEX defines \smallskip, etc. in lt-space.dtx.

415 \def\narrower{%
416 \advance\leftskip\parindent
417 \advance\rightskip\parindent}

LATEX defines \ae and similar commands elsewhere.
418 \chardef\%= '\%
419 \chardef\&= '\&
420 \chardef\#= '\#
```

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

```

\leavevmode begins a paragraph, if necessary
421 \def\leavevmode{\unhbox\voidb@x}

\mathhexbox
422 \def\mathhexbox#1#2#3{\mbox{${\m@th \mathchar"#1#2#3$}}

\ialign
423 \def\ialign{\everycr{ }\tabskip\z@skip\halign} % initialized \halign

\oalign
\o@lign 424 \def\oalign#1{\leavevmode\top{\baselineskip\z@skip \lineskip.25ex%
\oalign 425 \ialign{##\crcr#1\crcr}}
426 \def\o@lign{\lineskiplimit\z@ \oalign}
427 \def\ooalign{\lineskiplimit-\maxdimen \oalign}

\sh@ft The definition of this macro in plain.tex was improved in about 1997; but as a
result its usage was changed and its new definition is not appropriate for LATEX.
Since the version given here has been in use by LATEX for many years it does
not seem prudent to remove it now. As far as we can tell it has only been used to
define \b and \d but this cannot be certain.
428 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font
429 \kern-.0156\dimen@} % compensate for slant in lowered accents

\ltx@sh@ft This is the LATEX version of the second incarnation of the plain macro \sh@ft,
which takes a dimension as its argument. It shifts a pseudo-accent horizontally
by an amount proportional to the product of its argument and the slant-per-point
(fontdimen 1).
430 \def\ltx@sh@ft #1{%
431 \dimen@ #1%
432 \kern \strip@pt
433 \fontdimen1\font \dimen@
434 } % kern by #1 times the current slant

LATEX change: the text commands such as \d, \b, \c, \copyright, \TeX are
now defined elsewhere.
LATEX change: Make \t work in a moving argument. Now defined elsewhere.

\hrulefill LATEX change: \kern\z@ added to end of \hrulefill and \dotfill to make them
\dotfill work in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). LATEX
change: \leavevmode added at beginning of \dotfill and \hrulefill so that
they work as expected in vertical mode.
435 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}
The box in \dotfill originally contained (in plain.tex):
\mkern 1.5mu .\mkern 1.5mu;
the width of .44em differs from this by .04pt which is probably an acceptable
difference within leaders.
436 \def\dotfill{%
437 \leavevmode
438 \cleaders \hb@xt@ .44em{\hss.\hss}\hfill
439 \kern\z@}

```

INITEX sets `\sfcode x=1000` for all  $x$ , except that `\sfcode 'X=999` for uppercase letters. The following changes are needed:

```
440 \sfcode'\)=0 \sfcode'\'=0 \sfcode'\]=0
```

The `\nonfrenchspacing` macro will make further changes to `\sfcode` values.

Definitions related to output

`\magnification` doesn't work in L<sup>A</sup>T<sub>E</sub>X.

## ltdfn.dtx

### 11 Definitions

This section contains commands used in defining other macros.

```
1 (*2kernel)
```

#### 11.1 Initex initialisations

`\two@digits` Prefix a number less than 10 with ‘0’.

```
2 \def\two@digits#1{\ifnum#1<10 0\fi\number#1}
```

`\typeout` Display something on the terminal.

```
3 \def\typeout#1{\begingroup\set@display@protect
4   \immediate\write\@unused{#1}\endgroup}
```

`\newlinechar` A char to be used as new-line in output to files.

```
5 \newlinechar‘\^^J
```

#### 11.2 Saved versions of TeX primitives

The TeX primitive `\foo` is saved as `\@@foo`. The following primitives are handled in this way:

`\@@par`

```
6 \let\@@par=\par
7 %\let\@@input=\input      %%% moved earlier
8 %\let\@@end=\end         %%%
```

`\@@hyph` Save original primitive definition.

```
9 \let\@@hyph=\-
```

`\@@italiccorr` Save the original italic correction.

```
10 \let\@@italiccorr=\/
```

`\@height` The following definitions save token space. E.g., using `\@height` instead of `height` saves 5 tokens at the cost in time of one macro expansion.

```
\@depth 11 \def\@height{height} \def\@depth{depth} \def\@width{width}
\@width 12 \def\@minus{minus}
\@minus 13 \def\@plus{plus}
```

`\hb@xt@` The next one is another 100 tokens worth.

```
14 \def\hb@xt@{\hbox to}
15 \message{hacks,}
```

## 11.3 Command definitions

This section defines the following commands:

<code>\@namedef</code>	<code>{\NAME}</code>	Expands to <code>\def\{NAME}</code> , except name can contain any characters.
<code>\@nameuse</code>	<code>{\NAME}</code>	Expands to <code>\{NAME}</code> .
<code>\@ifnextchar</code>	<code>X{\YES}{\NO}</code>	Expands to <code>\YES</code> if next character is an ‘X’, and to <code>\NO</code> otherwise. (Uses <code>\reserved@a–\reserved@c.</code> ) NOTE: GOBBLES ANY SPACE FOLLOWING IT.
<code>\@ifstar</code>	<code>{\YES}{\NO}</code>	Gobbles following spaces and then tests if next the character is a ‘*’. If it is, then it gobbles the ‘*’ and expands to <code>\YES</code> , otherwise it expands to <code>\NO</code> .
<code>\@dblarg</code>	<code>{\CMD}{\ARG}</code>	Expands to <code>\{\CMD}\[\ARG]{\ARG}</code> . Use <code>\@dblarg\CS</code> when <code>\CS</code> takes arguments <code>[ARG1]{ARG2}</code> , where default is <code>ARG1 = ARG2</code> .
<code>\@ifundefined</code>	<code>{\NAME}{\YES}{\NO}</code>	: If <code>\NAME</code> is undefined then it executes <code>\YES</code> , otherwise it executes <code>\NO</code> . More precisely, true if <code>\NAME</code> either undefined or <code>= \relax</code> .
<code>\@ifdefinable</code>	<code>\NAME{\YES}</code>	Executes <code>\YES</code> if the user is allowed to define <code>\NAME</code> , otherwise it gives an error. The user can define <code>\NAME</code> if <code>\@ifundefined{NAME}</code> is true, ‘NAME’ $\neq$ ‘relax’ and the first three letters of ‘NAME’ are not ‘end’, and if <code>\endNAME</code> is not defined.
<code>\newcommand</code>	<code>*{\FOO}[i]{TEXT}</code>	User command to define <code>\FOO</code> to be a macro with <i>i</i> arguments ( <i>i</i> = 0 if missing) having the definition <code>\TEXT</code> . Produces an error if <code>\FOO</code> already defined. Normally the command is defined to be <code>\long</code> (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as <code>\long</code> and a blank line in any argument to the command would generate an error.
<code>\renewcommand</code>	<code>*{\FOO}[i]{TEXT}</code>	Same as <code>\newcommand</code> , except it checks if <code>\FOO</code> already defined.
<code>\newenvironment</code>	<code>*{\FOO}[i]{DEF1}{DEF2}</code>	equivalent to: <code>\newcommand{\FOO}[i]{DEF1} \def{\endFOO}{DEF2}</code> (or the appropriate star forms).
<code>\renewenvironment</code>		Obvious companion to <code>\newenvironment</code> .
<code>\@cons</code>		: See description of <code>\output</code> routine.
<code>\@car</code>	<code>\@car T1 T2 ... Tn\@nil == T1</code>	(unexpanded)
<code>\@cdr</code>	<code>\@cdr T1 T2 ... Tn\@nil == T2 ... Tn</code>	(unexpanded)
<code>\typeout</code>	<code>{\message}</code>	Produces a warning message on the terminal.
<code>\typein</code>	<code>{\message}</code>	Types message, asks the user to type in a command, then executes it
<code>\typein</code>	<code>[\CS]{MSG}</code>	Same as above, except defines <code>\CS</code> to be the input instead of executing it.
<code>\typein</code>	<code>16 \def\typein{%</code>	

```

17 \let\@typein\relax
18 \@testopt\@xtypein\@typein}

19 \ifx\directlua\@undefined

32 \expandafter\def\expandafter#1\expandafter{#1}%
33 \@typein}%

34 \fi

\@namedef
35 \def\@namedef#1{\expandafter\def\csname #1\endcsname}

\@nameuse
36 \def\@nameuse#1{\csname #1\endcsname}

\@cons
37 \def\@cons#1#2{\begingroup\let\@elt\relax\xdef#1{#1\@elt #2}\endgroup}

\@car
\@cdr
38 \def\@car#1#2\@nil{#1}
39 \def\@cdr#1#2\@nil{#2}

\@carcube \@carcube T1 ... Tn\@nil = T1 T2 T3 , n > 3
40 \def\@carcube#1#2#3#4\@nil{#1#2#3}

\@onlypreamble This macro adds its argument to the list of commands stored in \@preamblecmds
\@preamblecmds to be disabled after \begin{document}. These commands are redefined to gener-
ate \@notprerr at this point.
41 \def\@preamblecmds{}
42 \def\@onlypreamble#1{%
43 \expandafter\gdef\expandafter\@preamblecmds\expandafter{%
44 \@preamblecmds\do#1}}
45 \@onlypreamble\@onlypreamble
46 \@onlypreamble\@preamblecmds

\@star@or@long Look ahead for a *. If present reset \l@ngrel@x so that the next definition, #1,
will be non-long.
47 \def\@star@or@long#1{%
48 \@ifstar
49 {\let\l@ngrel@x\relax#1}%
50 {\let\l@ngrel@x\long#1}}

```

`\l@ngrel@x` This is either `\relax` or `\long` depending on whether the `*`-form of a definition command is being executed.

```
51 \let\l@ngrel@x\relax
```

`\newcommand` User level `\newcommand`.

```
52 \def\newcommand{\@star@or@long\newcommand}
```

`\new@command`

```
53 \def\new@command#1{%
54   \@testopt{\@newcommand#1}0}
```

`\@newcommand` Handling arguments for `\newcommand`.

```
\@argdef 55 \def\@newcommand#1[#2]{%
\@xargdef 56   \kernel@ifnextchar [ {\@xargdef#1[#2]}%
57           {\@argdef#1[#2]}}
```

Define `#1` if it is definable.

Both here and in `\@xargdef` the replacement text is absorbed as an argument because if we are not allowed to make the definition we have to get rid of it completely.

```
58 \long\def\@argdef#1[#2]#3{%
59   \@ifdefinable #1{\@yargdef#1\@ne{#2}{#3}}}
```

Handle the second optional argument.

```
60 \long\def\@xargdef#1[#2] [#3]#4{%
61   \@ifdefinable#1{%
```

Define the actual command to be:

```
\def\foo{\@protected@testopt\foo\foo{default}}
```

where `\foo` is a csname generated from applying `\csname` and `\string` to `\foo`, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of `(re)newcommand`.

```
62   \expandafter\def\expandafter#1\expandafter{%
63     \expandafter
64     \@protected@testopt
65     \expandafter
66     #1%
67     \csname\string#1\endcsname
68     {#3}}%
```

Now we define the internal macro ie `\foo` which is supposed to pick up all arguments (optional and mandatory).

```
69   \expandafter\@yargdef
70   \csname\string#1\endcsname
71   \tw@
72   {#2}%
73   {#4}}}
```

`\@testopt` This macro encapsulates the most common call to `\@ifnextchar`, saving several tokens each time it is used in the definition of a command with an optional argument. `#1` The code to execute in the case that there is a `[` need not be a single token but can be any sequence of commands that 'expects' to be followed by `[`.

If this command were only used in `\newcommand` definitions then `#1` would be a single token and the braces could be omitted from `{#1}` in the definition below, saving a bit of memory.

```
74 \long\def\@testopt#1#2{%
75   \kernel@ifnextchar[#{1}{#1[#{2}]]}}
```

`\@protected@testopt` Robust version of `\@testopt`. The extra argument (`#1`) must be a single token. If protection is needed the call expands to `\protect` applied to this token, and the 2nd and 3rd arguments are discarded (by `\@x@protect`). Otherwise `\@testopt` is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the `\ifx` test.

```
76 \def\@protected@testopt#1{%
77   \ifx\protect\@typeset@protect
78     \expandafter\@testopt
79   \else
80     \@x@protect#1%
81   \fi}
```

`\@yargdef` These generate a primitive argument specification, from a L<sup>A</sup>T<sub>E</sub>X [*digit*] form; `\@yargdef` in fact *digit* can be anything such that `\number <digit>` is single digit.

Reorganised slightly so that `\renewcommand{\reserved@a}[1]{foo}` works. I am not sure this is worth it, as a following `\newcommand` would over-write the definition of `\reserved@a`.

Recall that L<sup>A</sup>T<sub>E</sub>X 2.09 goes into an infinite loop with `\renewcommand[1]{\@tempa}{foo}` (DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using `#2 = \tw@` as the flag to surround the first argument with []). But the new method did not allow for the number of arguments `#3` not being given as an explicit digit; hence (further expansion of this argument and use of) `\number` was added later in 1999.

It is not clear why these are still `\long`.

```
82 \long \def \@yargdef #1#2#3{%
83   \ifx#2\tw@
84     \def\reserved@b##11{[####1]}%
85   \else
86     \let\reserved@b\@gobble
87   \fi
88   \expandafter
89   \@yargdef \expandafter{\number #3}#1%
90 }

91 \long \def \@yargdef#1#2{%
92   \def \reserved@a ##1#1##2##{%
93     \expandafter\def\expandafter#2\reserved@b ##1#1%
94   }%
95   \l@ngrel@x \reserved@a 0##1##2##3##4##5##6##7##8##9####1%
96 }
```

```

\@reargdef
    97 \long\def\@reargdef#1[#2]{%
    98   \yargdef#1\@ne{#2}}

\renewcommand Check the command name is already used. If not give an error message. Then
temporarily disable \@ifdefinable then call \newcommand. (Previous version
\let#1=\relax but this does not work too well if #1 is \@tempa-e.)
    99 \def\renewcommand{\@star@or@long\renew@command}

    115     \fi}%
    116     \notdefinable}

Saved definition of \@ifdefinable.
    117 \let\@@ifdefinable\@ifdefinable

Version of \@ifdefinable for use with \renewcommand. Does not do the check
this time, but restores the normal definition.
    118 \long\def\@rc@ifdefinable#1#2{%
    119   \let\@ifdefinable\@@ifdefinable
    120   #2}

\newenvironment Define a new user environment. #1 is the environment name. #2# Grabs all the
tokens up to the first {. These will be any optional arguments. They are not
parsed at this point, but are just passed to \@newenv which will eventually call
\newcommand. Any optional arguments will then be parsed by \newcommand as it
defines the command that executes the ‘begin code’ of the environment.
    This #2# trick removed with version 1.2i as it fails if a { occurs in the optional
argument. Now use \@ifnextchar directly.
    121 \def\newenvironment{\@star@or@long\new@environment}

\new@environment
    122 \def\new@environment#1{%
    123   \@testopt{\@newenva#1}0}

```

```

\@newenva
124 \def\@newenva#1[#2]{%
125   \kernel@ifnextchar [{\@newenvb#1[#2]}{\@newenv{#1}{[#2]}}}]

\@newenvb
126 \def\@newenvb#1[#2][#3]{\@newenv{#1}{[#2][[#3]]}}

\renewenvironment Redefine an environment. For \renewenvironment disable \@ifdefinable and
then call \newenvironment. It is OK to \let the argument to \relax here as
there should not be a @temp... environment.
127 \def\renewenvironment{\@star@or@long\renew@environment}

\renew@environment
128 \def\renew@environment#1{%
129   \@ifundefined{#1}%
130     {\@latex@error{Environment #1 undefined}\@ehc
131     }\relax
132   \expandafter\let\csname#1\endcsname\relax
133   \expandafter\let\csname end#1\endcsname\relax
134   \new@environment{#1}}

\@newenv The internal version of \newenvironment.
Call \newcommand to define the begin-code for the environment. \def is used
for the end-code as it does not take arguments. (but may contain \pars)
Make sure that an attempt to define a ‘graf’ or ‘group’ environment fails.
135 \long\def\@newenv#1#2#3#4{%
136   \@ifundefined{#1}%
137     {\expandafter\let\csname#1\expandafter\endcsname
138       \csname end#1\endcsname}%

140   \expandafter\new@command
141     \csname #1\endcsname#2{#3}%
142     \l@ngrel@x\expandafter\def\csname end#1\endcsname{#4}}

\newif And here’s a different sort of allocation: For example, \newif\iffoo creates
\footrue, \foofalse to go with \iffoo.
143 \def\newif#1{%
144   \count@\escapechar \escapechar@m@ne
145   \let#1\iffalse
146   \@if#1\iftrue
147   \@if#1\iffalse
148   \escapechar\count@}

\@if
149 \def\@if#1#2{%
150   \expandafter\def\csname\expandafter\@gobbletwo\string#1%
151     \expandafter\@gobbletwo\string#2\endcsname
152     {\let#1#2}}

\providecommand \providecommand takes the same arguments as \newcommand, but discards them
if #1 is already defined, Otherwise it just acts like \newcommand. This imple-
mentation currently leaves any discarded definition in \reserved@a (and possibly

```

`\reserved@a`) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

```
153 \def\providecommand{\@star@or@long\providecommand}
```

`\providecommand`

```
154 \def\providecommand#1{%
155   \begingroup
156   \escapechar\m@ne\xdef\@gtempa{\string#1}%
157   \endgroup
158   \expandafter\ifundefined\@gtempa
159     {\def\reserved@a{\newcommand#1}}%
160     {\def\reserved@a{\renewcommand\reserved@a}}%
161   \reserved@a}%
```

`\CheckCommand` `\CheckCommand` takes the same arguments as `\newcommand`. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state before a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: `\newcommand\xxx[2][a]{(#1)(#2)}` then `\CheckCommand\xxx[2][b]{(#1)(#2)}` would *not* generate a warning, but, for instance `\CheckCommand\xxx[2]{(#1)(#2)}` would.

```
162 \def\CheckCommand{\@star@or@long\checkcommand}
```

`\CheckCommand` is only available in the preamble part of the document.

```
163 \@onlypreamble\CheckCommand
```

`\checkcommand`

```
164 \def\checkcommand#1#2#\@check@c#1{#2}%
165 \@onlypreamble\checkcommand
```

`\@check@c` `\CheckCommand` itself just grabs all the arguments we need, without actually looking for [ optional argument forms. Now define `\reserved@a`. If `\reserved@a` is then defined, compare it with the “`\#1`” otherwise compare `\reserved@a` with `\#1`.

```
166 \long\def\@check@c#1#2#3{%
167   \expandafter\let\csname\string\reserved@a\endcsname\relax
168   \renewcommand\reserved@a#2{#3}%
169   \ifundefined{\string\reserved@a}%
170     {\@check@eq#1\reserved@a}%
171     {\expandafter\@check@eq
172       \csname\string#1\expandafter\endcsname
173       \csname\string\reserved@a\endcsname}}
174 \@onlypreamble\@check@c
```

`\@check@eq` Complain if `\#1` and `\#2` are not `\ifx` equal.

```
175 \def\@check@eq#1#2{%
176   \ifx#1#2\else
177     \@latex@warning@no@line
178       {Command \noexpand#1 has
179         changed.\MessageBreak
180         Check if current package is valid}%
181   \fi}
182 \@onlypreamble\@check@eq
```

```

    \@gobble The \@gobble macro is used to get rid of its argument.
    \@gobbletwo 183 \long\def \@gobble #1{}
    \@gobblefour 184 \long\def \@gobbletwo #1#2{}
    185 \long\def \@gobblefour #1#2#3#4{}

    \@firstofone Some argument-grabbers.
    \@firstoftwo 186 \long\def \@firstofone#1{#1}
    \@secondoftwo 187 \long\def \@firstoftwo#1#2{#1}
    188 \long\def \@secondoftwo#1#2{#2}

    \@iden \@iden is another name for \@firstofone for compatibility reasons.
    189 \let \@iden \@firstofone

    \@thirdofthree Another grabber now used in the encoding specific section.
    190 \long\def \@thirdofthree#1#2#3{#3}

    \@expandtwoargs A macro to totally expand two arguments to another macro
    191 \def \@expandtwoargs#1#2#3{%
    192 \edef \reserved@a{\noexpand#1{#2}{#3}}\reserved@a}

    \@backslashchar A category code 12 backslash.
    193 \edef \@backslashchar{\expandafter \@gobble \string\}

```

## 11.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in  $\text{\LaTeX}$ 's commands. Whilst typesetting documents,  $\text{\LaTeX}$  makes use of many of  $\text{\TeX}$ 's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by  $\text{\LaTeX}$ , and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an  $\backslash\text{edef}$ ,  $\backslash\text{message}$ ,  $\backslash\text{mark}$ , or other command which evaluates its argument fully.

The method  $\text{\LaTeX}$  uses for making fragile commands robust is to precede them with  $\backslash\text{protect}$ . This can have one of five possible values:

- $\backslash\text{relax}$ , for normal typesetting. So  $\backslash\text{protect}\text{\foo}$  will execute  $\text{\foo}$ .
- $\backslash\text{string}$ , for writing to the screen. So  $\backslash\text{protect}\text{\foo}$  will write  $\text{\foo}$ .
- $\backslash\text{noexpand}$ , for writing to a file. So  $\backslash\text{protect}\text{\foo}$  will write  $\text{\foo}$  followed by a space.
- $\backslash\text{unexpandable@protect}$ , for writing a moving argument to a file. So  $\backslash\text{protect}\text{\foo}$  will write  $\backslash\text{protect}\text{\foo}$  followed by a space. This value is also used inside  $\backslash\text{edefs}$ ,  $\backslash\text{marks}$  and other commands which evaluate their arguments fully. More precisely, whenever the content of an  $\backslash\text{edef}$  or  $\backslash\text{xdef}$

etc. can contain arbitrary user input not under the direct control of the programmer, one should use `\protected@edef` instead of `\edef`, etc., so that `\protect` has a suitable definition and the user input will not break if it contains fragile commands.

`\@unexpandable@protect`

```
194 \def\@unexpandable@protect{\noexpand\protect\noexpand}
```

`\DeclareRobustCommand` This is a package-writers command, which has the same syntax as `\newcommand`,  
`\declare@robustcommand` but which declares a protected command. It does this by having

```
\DeclareRobustCommand\foo
define \foo to be \protect\foo<space>,
and then use \newcommand\foo<space>.
Since the internal command is \foo<space>, when it is written to an auxiliary
file, it will appear as \foo.
```

We have to be a bit cleverer if we're defining a short command, such as `\_`, in order to make sure that the auxiliary file does not include a space after the command, since `\_ a` and `\_a` aren't the same. In this case we define `\_` to be:

```
\x@protect\_ \protect\_<space>
```

which expands to:

```
\ifx\protect\@typeset@protect\else
  \x@protect\_
\fi
\protect\_<space>
```

Then if `\protect` is `\@typeset@protect` (normally `\relax`) then we just perform `\_<space>`, and otherwise `\x@protect@` gobbles everything up and expands to `\protect\_`.

*Note:* setting `\protect` to any value other than `\relax` whilst in 'typesetting' mode will cause commands to go into an infinite loop! In particular, setting `\relax` to `\@empty` will cause `\_` to loop forever. It will also break lots of other things, such as protected `\ifmmodes` inside `\haligns`. If you really really have to do such a thing, then please set `\@typeset@protect` to be `\@empty` as well. (This is what the code for `\patterns` does, for example.)

More fun with `\expandafter` and `\csname`.

```
195 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
196 \def\declare@robustcommand#1{%
197   \ifx#1\@undefined\else\ifx#1\relax\else

202   \edef\reserved@b{\expandafter\strip@prefix\meaning\reserved@b}%
203   \edef#1{%
204     \ifx\reserved@a\reserved@b
205       \noexpand\x@protect
206       \noexpand#1%
207     \fi
```

```

208     \noexpand\protect
209     \expandafter\noexpand\csname
210         \expandafter\@gobble\string#1 \endcsname
211     }%
212 \let\@ifdefinable\rc@ifdefinable
213 \expandafter\new@command\csname
214     \expandafter\@gobble\string#1 \endcsname
215 }

\@x@protect
\@x@protect 216 \def\@x@protect#1{%
217     \ifx\protect\@typeset@protect\else
218         \@x@protect#1%
219     \fi
220 }
221 \def\@x@protect#1\fi#2#3{%
222     \fi\protect#1%
223 }

\@typeset@protect
224 \let\@typeset@protect\relax

\set@display@protect These macros set \protect appropriately for typesetting or displaying.
\set@typeset@protect 225 \def\set@display@protect{\let\protect\string}
226 \def\set@typeset@protect{\let\protect\@typeset@protect}

\protected@edef The commands \protected@edef and \protected@xdef perform ‘safe’ \edefs
\protected@xdef and \xdefs, saving and restoring \protect appropriately. For cases where restoring
\unrestored@protected@xdef \protect doesn’t matter, there’s an ‘unsafe’ \unrestored@protected@xdef,
\restore@protect useful if you know what you’re doing!
227 \def\protected@edef{%
228     \let\@@protect\protect
229     \let\protect\@unexpandable@protect
230     \afterassignment\restore@protect
231     \edef
232 }
233 \def\protected@xdef{%
234     \let\@@protect\protect
235     \let\protect\@unexpandable@protect
236     \afterassignment\restore@protect
237     \xdef
238 }
239 \def\unrestored@protected@xdef{%
240     \let\protect\@unexpandable@protect
241     \xdef
242 }
243 \def\restore@protect{\let\protect\@@protect}

\protect The normal meaning of \protect
244 \set@typeset@protect

```

`\MakeRobust` The macro firstly checks if the controls sequence in question exists at all.

```
245 </2ekernel>
246 <latexrelease>\IncludeInRelease{2015/01/01}{\MakeRobust}{\MakeRobust}%
247 <*2ekernel | latexrelease>
248 \def\MakeRobust#1{%
249   \ifundefined{\expandafter\@gobble\string#1}{%
250     \latex@error{The control sequence ‘\string#1’ is undefined!%
251       \MessageBreak There is nothing here to make robust}%
252     \@eha
253   }%
```

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely `\foo_`. If it is already defined do nothing, otherwise set `\foo_` equal to `\foo` and redefine `\foo` so that it acts like a macro defined with `\DeclareRobustCommand`.

```
254   {%
255     \ifundefined{\expandafter\@gobble\string#1\space}%
256     {%

316 <latexrelease> \fi}
317 <latexrelease>\EndIncludeInRelease
318 <*2ekernel>

```

\@qend The following define \@qend and \@qrelax to be the strings ‘end’ and ‘relax’  
\@qrelax with the characters \catcoded 12.

```

319 \edef\@qend{\expandafter\@cdr\string\end\@nil}
320 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}

```

\@ifnextchar \@ifnextchar peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.

```

321 \long\def\@ifnextchar#1#2#3{%

```

```

322 \let\reserved@d=#1%
323 \def\reserved@a{#2}%
324 \def\reserved@b{#3}%
325 \futurelet\@let@token\@ifnch}

```

`\kernel@ifnextchar` This macro is the kernel version of `\@ifnextchar` which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an `fd` file is loaded in a random place then the optional argument to `\ProvidesFile` could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the `amsmath` package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

```

326 \let\kernel@ifnextchar\@ifnextchar

```

`\@ifnch` `\@ifnch` is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls `xifnch`.

```

327 \def\@ifnch{%
328   \ifx\@let@token\@sptoken
329     \let\reserved@c\@xifnch
330   \else
331     \ifx\@let@token\reserved@d
332       \let\reserved@c\reserved@a
333     \else
334       \let\reserved@c\reserved@b
335     \fi
336   \fi
337   \reserved@c}

```

`\@sptoken` The following code makes `\@sptoken` a space token. It is important here that the control sequence `\:` consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a `\let` may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of `\:` as math medium space.

```

338 \def\:\{\let\@sptoken= } \: % this makes \@sptoken a space token

```

`\@xifnch` In the following definition of `\@xifnch`, `\:` is again used to get a space token as delimiter into the definition.

```

339 \def\:\{\@xifnch} \expandafter\def\:\: {\futurelet\@let@token\@ifnch}

```

`\makeatletter` Make internal control sequences accessible or inaccessible.

```

\makeatother
340 \def\makeatletter{\catcode'\@11\relax}
341 \def\makeatother{\catcode'\@12\relax}

```

`\@ifstar` The new implementation below avoids passing the *⟨true code⟩* Through one more `\def` than the *⟨false code⟩*, which previously meant that `#` had to be written as `####` in one argument, but `##` in the other. The `*` is gobbled by `\@firstoftwo`.

```

342 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}}

```

```

\@dblarg
\@xdblarg 343 \long\def\@dblarg#1{\kernel@ifnextchar[#{1}]{\@xdblarg{#1}}}
344 \long\def\@xdblarg#1#2{#1[#{2}]{#2}}

\@sanitize The command \@sanitize changes the catcode of all special characters except
for braces to ‘other’. It can be used for commands like \index that want to write
their arguments verbatim. Needless to say, this command should only be executed
within a group, or chaos will ensue.

345 \def\@sanitize{\@makeother\ \@makeother\\\@makeother$\@makeother\&%
346 \@makeother\#\@makeother^\@makeother_\@makeother%\@makeother\~}

\@onelevel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12
tokens: it could be used in \DeclareRobustCommand.
If it is to be used on default float specifiers, this should be done when they are
defined.

347 \def \@onelevel@sanitize #1{%
348 \edef #1{\expandafter\strip@prefix
349 \meaning #1}%
350 }

```

## 12 Discretionary Hyphenation

```

\@dischph
\@dischph Moved here to be after the definition of \DeclareRobustCommand.
The primitive \- command adds a discretionary hyphen using the current font’s
\hyphenchar. Monospace fonts are usually declared with \hyphenchar set to -1
to suppress hyhenation.
LATEX, from LATEX2.09 in 1986 defined \- by
\def\-\{\discretionary{-}{-}{-}}

```

The following comment was added when these commands were first set up, 19 April 1986:

the \- command is redefined to allow it to work in the \ttfamily type style, where automatic hyphenation is suppressed by setting \hyphenchar to -1. The original primitive T<sub>E</sub>X definition is saved as \@@hyph just in case anyone needs it.

L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>, between 1993 and 2017, had a comment at this point saying that the definition “would probably change” because the definition always uses -. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older L<sup>A</sup>T<sub>E</sub>X definition accessible via latexrelease as usual.

```

351 </2ekernel>
352 <latexrelease>\IncludeInRelease{2017/04/15}{\-\}{Use \hyphenchar in \-}%
Temporary definition of \@latex@info, final definition is later.
353 <*2ekernel>
354 \def\@latex@info#1{}
355 </2ekernel>

```

```

356 <*2ekernel | latexrelease>
357 \DeclareRobustCommand{\-}{\%

### 13 Counters

This section deals with counter and other variable allocation.

1 (\*2kernel)

The following are from plain T<sub>E</sub>X:

\z@ A zero dimen or number. It's more efficient to write \parindent\z@ than  
    \parindent Opt.

\@ne The number 1.

\m@ne The number -1.

\tw@ The number 2.

\sxt@@n The number 16.

\@m The number 1000.

\@MM The number 20000.

\@xxxii The constant 32.

2 \chardef\@xxxii=32

\@Mi Constants 10001-10004.

\@Mii 3 \mathchardef\@Mi=10001

\@Miii 4 \mathchardef\@Mii=10002

\@Miv 5 \mathchardef\@Miii=10003

6 \mathchardef\@Miv=10004

\@tempcnta Scratch count registers used by L<sup>A</sup>T<sub>E</sub>X kernel commands.

\@tempcntb 7 \newcount\@tempcnta

8 \newcount\@tempcntb

\if@tempswa General boolean switch used by L<sup>A</sup>T<sub>E</sub>X kernel commands.

9 \newif\if@tempswa

\@tempdima Scratch dimen registers used by L<sup>A</sup>T<sub>E</sub>X kernel commands.

\@tempdimb 10 \newdimen\@tempdima

\@tempdimc 11 \newdimen\@tempdimb

12 \newdimen\@tempdimc

\@tempboxa Scratch box register used by L<sup>A</sup>T<sub>E</sub>X kernel commands.

13 \newbox\@tempboxa

\@tempskipa Scratch skip registers used by L<sup>A</sup>T<sub>E</sub>X kernel commands.

\@tempskipb 14 \newskip\@tempskipa

15 \newskip\@tempskipb

`\@temptokena` Scratch token register used by L<sup>A</sup>T<sub>E</sub>X kernel commands.  
16 `\newtoks\@temptokena`

`\@flushglue` Glue used for `\right-` & `\leftskip = 0pt plus 1fil`  
17 `\newskip\@flushglue \@flushglue = 0pt plus 1fil`  
18 `\kernel`

### 14 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

```
1 (*2kernel)
2 \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
    while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
    while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to
A1,A2,
    ... ,An .
    Executes BODY n times, with NAME = Ai on the i-th
iteration.
    Optimized for the normal case of n = 1. Works for n=0.

\@tfor NAME := LIST \do {BODY}
    if, before expansion, LIST = T1 ... Tn where each Ti is a
    token or {...}, then executes BODY n times, with NAME = Ti
    on the i-th iteration. Works for n=0.

NOTES: 1. These macros use no \@temp sequences.
        2. These macros do not work if the body contains anything that
        looks syntactically to TeX like an improperly balanced \if
        \else \fi.

\@whilenum TEST \do {BODY} ==
BEGIN
    if TEST
    then BODY
        \@iwhilenum{TEST \relax BODY}

## lterror.dtx

### 15 Error handling

This section defines L<sup>A</sup>T<sub>E</sub>X's error commands.

```
1 (*2kernel)
```

The '2kernel' code ensures that a `\usepackage{autoerr}` is essentially ignored if a 'full' format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

```
2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion
```

#### 15.1 General commands

`\MessageBreak` This command prints a new-line inside a message, followed by a continuation line begun with `\@msg@continuation`. Normally it is defined to be `\relax`, but inside messages, it is let to `\@message@break`.

```
3 \let\MessageBreak\relax
```

`\GenericInfo` This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5   \begingroup
6     \def\MessageBreak{^^J#1}%
7     \set@display@protect
8     \immediate\write\m@ne{#2\on@line.}%
9   \endgroup
10 }
```

`\GenericWarning` This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12   \begingroup
13     \def\MessageBreak{^^J#1}%
14     \set@display@protect
15     \immediate\write\@unused{^^J#2\on@line.^^J}%
16   \endgroup
17 }
```

`\GenericError` This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing `h` to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```
18 \bgroup
19 \lccode'\@=' \ %
```

```

20 \lccode'\~=' \ %
21 \lccode'\}= ' \ %
22 \lccode'\{=' \ %
23 \lccode'\T=' \T%
24 \lccode'\H=' \H%
25 \catcode'\ =11\relax%
26 \lowercase{%
27 \egroup%

```

Unfortunately T<sub>E</sub>X versions older than 3.141 have a bug which means that  $\sim J$  does not force a linebreak in `\message` and `\errmessage` commands. So for these old T<sub>E</sub>X's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

```
! .
```

To appear on the terminal, but if you do not like it, you can always upgrade your T<sub>E</sub>X! In order for your format to use this version, you must define the macro `\TeXversion` to be the version number, e.g., 3.14 of the underlying T<sub>E</sub>X. See the comments in `ltdircheck.dtx`.

```

28 \dimen@ifx\TeXversion\undefined4\else\TeXversion\fi\p@%
29 \ifdim\dimen@>3.14\p@%
    First the 'standard case'.
30 \DeclareRobustCommand{\GenericError}[4]{%
31 \begingroup%
32 \immediate\write\@unused{}%
33 \def\MessageBreak{\sim J}%
34 \set@display@protect%

80 {}}%
81 ~%
82 \endgroup}%
83 \fi}%

```

<pre> \PackageError \PackageWarning \PackageWarningNoLine \PackageInfo \ClassError \ClassWarning \ClassWarningNoLine \ClassInfo </pre>	<p>These commands are intended for use by package and class writers, to give information to authors. The syntax is:</p> <pre> \PackageError{&lt;package&gt;}{&lt;error&gt;}{&lt;help&gt;} \PackageWarning{&lt;package&gt;}{&lt;warning&gt;} \PackageWarningNoLine{&lt;package&gt;}{&lt;warning&gt;} \PackageInfo{&lt;package&gt;}{&lt;info&gt;} </pre>
--	--

and similarly for classes. The `Error` commands print the `<error>` message, and present the interactive prompt; if the author types `h`, then the `<help>` information is displayed. The `Warning` commands produce a warning but do not present the interactive prompt. The `WarningNoLine` commands do the same, but don't print the input line number. The `Info` commands write the message to the log file. Within the messages, the command `\MessageBreak` can be used to break a line, `\protect` can be used to protect command names, and `\space` is a space, for example:

```

\newcommand{\foo}{F00}
\PackageWarning{ethel}{%
  Your hovercraft is full of eels,\MessageBreak
  and \protect\foo\space is \foo}

```

produces:

```

Package ethel warning: Your hovercraft is full of eels,
(ethel)                and \foo is F00 on input line 54.

```

```

200               \space ended by \protect\end{#1}}\@eha}

```

`\@badmath` Called by `\[`, `\]`, `\(` or `\)` when used in wrong mode.

```

201 \gdef\@badmath{%
202   \latex@error{Bad math environment delimiter}\@eha}

```

`\@toodeep` Called by a list environment nested more than six levels deep, or an `enumerate` or `itemize` nested more than four levels.

```

203 \gdef\@toodeep{%
204   \latex@error{Too deeply nested}\@ehd}

```

`\@badpoptabs` Called by `\endtabbing` when not enough `\poptabs` have occurred, or by `\poptabs` when too many have occurred.

```

205 \gdef\@badpoptabs{%
206   \latex@error{\protect\pushtabs\space and \protect\poptabs
207               \space don't match}\@ehd}

```

`\@badtab` Called by `\>`, `\+`, `\-` or `\<` when stepping to an undefined tab.

```

208 \gdef\@badtab{%
209   \latex@error{Undefined tab position}\@ehd}

```

`\@preamerr` This error is special: it appears in places where we normally have to `\protect` expansions. However, to prevent a protection of the error message itself (which would result in the message getting printed not issued on the terminal) we need to locally reset `\protect` to `\relax`.

```

210 \gdef\@preamerr#1{%
211   \begingroup
212     \let\protect\relax
213     \latex@error{\ifcase #1 Illegal character\or
214                 Missing @-exp\or Missing p-arg\fi\space
215                 in array arg}\@ehd
216   \endgroup}

```

`\@badlinearg` Occurs in `\line` and `\vector` command when a bad slope argument is encountered.

```

217 \gdef\@badlinearg{%
218   \latex@error{%
219     Bad \protect\line\space or \protect\vector
220     \space argument}\@ehb}

```

`\@parmoderr` Occurs in a float environment or a `\marginpar` when encountered in inner vertical mode.

```
221 \gdef\@parmoderr{%
222   \@latex@error{Not in outer par mode}\@ehb}
```

`\@fltovf` Occurs in float environment or `\marginpar` when there are no more free boxes for storing floats.

```
223 \gdef\@fltovf{%
224   \@latex@error{Too many unprocessed floats}\@ehb}
```

`\@latexbug` Occurs in output routine. This is bad news.

```
225 \gdef\@latexbug{%
226   \@latex@error{This may be a LaTeX bug}{Call for help}}
```

`\@badcrerr` This error was removed and replaced by `\@nolnerr`.

```
227 %\def\@badcrerr {\@latex@error{Bad use of \protect}\@ehc}
```

`\@noitemerr` `\addvspace` or `\addpenalty` was called when not in vmode. Probably caused by a missing `\item`.

```
228 \gdef\@noitemerr{%
229   \@latex@error{Something's wrong--perhaps a missing %
230     \protect\item}\@ehc}
```

`\@notprerr` A command that can be used only in the preamble appears after the command `\begin{document}`.

```
231 \gdef\@notprerr{%
232   \@latex@error{Can be used only in preamble}\@eha}
```

`\@inmatherr` Issued by commands that don't work correctly within math (like `\item`). There is no real error recovery happening, e.g., the user might get additional errors afterwards.

```
233 \gdef\@inmatherr#1{%
234   \relax
235   \ifmmode
236     \@latex@error{Command \protect#1 invalid in math mode}\@ehc
237   \fi}
```

`\@invalidchar` An error for use with invalid characters. This is commented out, since we decided to use catcode 15 instead.

```
238 %\def\@invalidchar{\@latex@error{Invalid character in input}\@ehc}
239 \endkernel)
```

As well as the above error commands some error messages are directly coded to save space. The messages already present in  $\text{\LaTeX}2.09$  include:

`Environment --- undefined`

Issued by `\begin` for undefined environment.

`Tab overflow`

Occurs in `\=` when maximum number of tabs exceeded.

`\< in mid line`

Occurs in `\<` when it appears in middle of line.

`Float(s) lost`

In output routine, caused by a float environment or `\marginpar` occurring in inner vertical mode.

# File h

## ltpar.dtx

### 16 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` when ever their function needs to be changed for a long time.

#### 16.1 Implementation

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
  - All list environments (itemize, quote, etc.)
  - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
  - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
  - The mechanism for avoiding page breaks and getting the spacing right after section heads.

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{<VAL>}` command. It's function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `<VAL>`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@@par` `\@@par` always is defined to be the original  $\TeX$  `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

1. Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace

where `\everypar` has been redefined). Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.

2. Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```
1 (*2kernel)
2 \message{par,}
```

`\@setpar` Initiate a long-term change to `\par`.

```
\@par 3 \def\@setpar#1{\def\par{#1}\def\@par{#1}}
```

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@par` after one iteration.

```
4 \def\@par{\let\par\@par\par}
```

`\@restorepar` Restore from a short-term change to `\par`.

```
5 \def\@restorepar{\def\par{\@par}}
6 /2kernel)
```

# File i

## ltspace.dtx

### 17 Spacing

This section deals with spacing, and line- and page-breaking.

#### 17.1 User Commands

`\nopcodebreak` [*i*] : *i* = 0,...,4.  
Default argument = 4. Puts a penalty into the vertical list output as follows:  
0 : penalty = 0  
1 : penalty = `\@lowpenalty`  
2 : penalty = `\@medpenalty`  
3 : penalty = `\@highpenalty`  
4 : penalty = 10000

`\pagebreak` [*i*] : same as except negatives of its penalty  
`\linebreak` [*i*] : analog of the above  
`\nolinebreak` [*i*] : analog of the above  
`\samepage` : inhibits page breaking most places by setting the following penalties to 10000:  
`\interlinepenalty`  
`\postdisplaypenalty`  
`\interdisplaylinepenalty`  
`\@beginparpenalty`  
`\@endparpenalty`  
`\@itempenalty`  
`\@secpenalty`  
`\interfootnotelinepenalty`

`\` : initially defined to be `\newline`  
`\` [*length*] : initially defined to be `\vspace{<length>}\newline`  
Note: `\`\* adds a `\adjust{\penalty 10000}`  
OBSOLETE COMMANDS (which never made it into the manual):  
`\obeycr` : defines `¡CRi == \\relax`  
`\restorecr` : restores `¡CRi` to its usual meaning.

#### 17.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is

the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
  \item \label{item:xxx} Item text.
\end{enumerate}
```

### 17.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `\\*`.
- Reimplement `\\`, etc, removing extra `\vadjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\\`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskips` include test for zero skip (rather than other tests or no test).

- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.
- Resolve the inconsistency between `\hspace` and `\hspace*`.
- Remove unnecessary `\unskips`.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix T<sub>E</sub>X itself.

## 17.4 The code

```

1 (*2kernel)
2 \message{spacing,}

\pagebreak
\nopagebreak 3 \def\pagebreak{\@testopt{\@no@pgbk-}4}
4 \def\nopagebreak{\@testopt{\@no@pgbk4}

26 \fi}

\samepage
27 \def\samepage{\interlinepenalty\@M
28 \postdisplaypenalty\@M

```

```

29 \interdisplaylinepenalty\@M
30 \@beginparpenalty\@M
31 \@endparpenalty\@M
32 \@itempenalty\@M
33 \@secpenalty\@M
34 \interfootnotelinepenalty\@M}

```

`\@` The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

1. efficient execution of plain `\@`;
2. efficient execution of `\@[...]`;
3. memory use;
4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use `\reserved@e` and `\reserved@f` here (other reserved macros are somewhat disastrous).

These changes made `\newline` even less robust than it had been, so now it is explicitly robust, like `\@`.

`\@normalcr` The internal definition of the ‘normal’ definition of `\@`.

```

35 \DeclareRobustCommand\@{\%
36 \let \reserved@e \relax
37 \let \reserved@f \relax
38 \@ifstar{\let \reserved@e \vadjust \let \reserved@f \nobreak
39 \xnewline}%
40 \xnewline}
41 \expandafter\let\expandafter\@normalcr
42 \csname\expandafter\@gobble\string\@ \endcsname

```

`\newline` A simple form of the ‘normal’ definition of `\@`.

```

43 \DeclareRobustCommand\newline{\@normalcr\relax}

```

`\@xnewline`

```

44 \def\@xnewline{\@ifnextchar[% ] bracket matching
45 \newline
46 {\@gnewline\relax}}

```

`\@newline`

```

47 \def\@newline[#1]{\let \reserved@e \vadjust
48 \@gnewline {\vskip #1}}

```

`\@gnewline` The `\nobreak` added to prevent null lines when `\@` ends an overfull line. Change made 24 May 89 as suggested by Frank Mittelbach and Rainer Schöpf

```

49 \def\@gnewline #1{\%
50 \ifvmode
51 \@nolnerr
52 \else
53 \unskip \reserved@e {\reserved@f#1}\nobreak \hfil \break
54 \fi}

```

`\@getpen`

```
55 \def\@getpen#1{\ifcase #1 \z@ \or \@lowpenalty\or
56     \@medpenalty \or \@highpenalty
57     \else \@M \fi}
```

`\if@nbreak` Switch used to avoid page breaks caused by `\label` after a section heading, etc. It should be  **Globally** set true after the `\nbreak` and  **globally** set false by the next invocation of `\everypar`.

Commands that reset `\everypar` should globally set it false if appropriate.

```
58 \def\@nbreakfalse{\global\let\if@nbreak\iffalse}
59 \def\@nbreaktrue {\global\let\if@nbreak\iftrue}
60 \@nbreakfalse
```

`\@savsk` Registers used to save the space factor and last skip.

```
\@savsf 61 \newdimen\@savsk
        62 \newcount\@savsf
```

`\@bsphack` `\@esphack` and `\@esphack` used by macros such as `\index` and `\begin{@float}` ... `\end{@float}` that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with `\@bsphack` and end with `\@esphack`. The macro in question should not create any text, nor change the mode.

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when 'invisible commands' appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following `\addvspace`, etc sees the correct glue in `\lastskip`.

In fact, these improved versions should be used for other cases of 'whatsits, thingies etc' which should be invisible. They are only for commands, not environments (see notes on `\@Esphack`).

BTW, anyone know why the standard hacks are surrounded by `\ifmmode\else` rather than simply `\ifhmode`?

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
\def \@bsphack{%
  \relax \ifvmode
    \@savsk \lastskip
    \ifdim \lastskip=\z@
      \else
        \vskip -\lastskip
      \fi
    \else
      \ifhmode
        \@savsk \lastskip
        \@savsf \spacefactor
      \fi
    \fi
}
```

I think that, in vmode, it is the safest to put in a `\nobreak` immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```

\def \@esphack{%
  \relax \ifvmode
    \nobreak
    \ifdim \@savsk=\z@
    \else
      \vskip\@savsk
    \fi
  \else
    \ifhmode
      \spacefactor \@savsf
      \ifdim \@savsk>\z@
        \ignorespaces
      \fi
    \fi
  \fi
}

```

For the moment we are going to ignore the vertical versions until they are correct.

```

63 \def\@bsphack{%
64   \relax
65   \ifhmode
66     \@savsk\lastskip
67     \@savsf\spacefactor
68   \fi}

```

`\@esphack` Companion to `\@bsphack`. If this command is not properly paired with `\@bsphack` one might end up with a low-level T<sub>E</sub>X error: “BAD spacefactor”. One possible cause is calling `\@bsphack` in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling `\@esphack`. Even if no error is generated that is wrong, because `\@esphack` will then use the saved values for `\@savsk` and `\@savsf` from some earlier invocation of `\@bsphack` which will have nothing to do with the current situation.

```

```

`\@vbsphack` Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that `\@savsk` is nonzero so that the `\ignorespaces` is put in later. It is not used at present.

```

\def \@vbsphack{ %
  \relax \ifvmode
    \leavevmode
    \@savsk 1sp
    \@savsf \spacefactor
  \else
    \ifhmode
      \@savsk \lastskip
      \@savsf \spacefactor
    \fi
  \fi
}

```

## 17.5 Vertical spacing

L<sup>A</sup>T<sub>E</sub>X supports the plain T<sub>E</sub>X commands `\smallskip`, `\medskip` and `\bigskip`. However, it redefines them using `\vspace` instead of `\vskip`.

Extra vertical space is added by the command `\addvspace{⟨skip⟩}`, which adds a vertical skip of `⟨skip⟩` to the document. The sequence `\addvspace{⟨s1⟩} \addvspace{⟨s2⟩}` is equivalent to `\addvspace{⟨maximum of s1, s2⟩}`.

`\addvspace` should be used only in vertical mode, and gives an error if it's not. The `\addvspace` command does *not* add vertical space if `@minipage` is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the `\addpenalty{<penalty>}` command. It works properly when `\addpenalty` and `\addvspace` commands are mixed.

The `@nobreak` switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```

\addvspace{SKIP} ==
BEGIN
  if vmode
    then if @minipage
      else if \lastskip =0
        then \vskip SKIP
        else if \lastskip < SKIP
          then \vskip -\lastskip
          \vskip SKIP
          else if SKIP < 0 and \lastskip >= 0
            then \vskip -\lastskip
            \vskip \lastskip + SKIP
          fi      fi      fi      fi
      else useful error message (CAR).
    fi
  END

```

`\@xaddvskip` Internal macro for `\vspace` handling the case that space has previously been added.

```

157 \def\@xaddvskip{%
158   \ifdim\lastskip<\@tempkipb
159     \vskip-\lastskip
160     \vskip\@tempkipb
161   \else
162     \ifdim\@tempkipb<\z@
163       \ifdim\lastskip<\z@
164         \else
165           \advance\@tempkipb\lastskip
166           \vskip-\lastskip
167           \vskip \@tempkipb
168         \fi
169       \fi
170     \fi}

```

`\addvspace` Add vertical space taking into account space already added, as described above.

```

171 \def\addvspace#1{%
172   \ifvmode
173     \if@minipage\else
174       \ifdim \lastskip =\z@
175         \vskip #1\relax
176       \else
177         \@tempkipb#1\relax
178         \@xaddvskip

180     \fi
181   \else

```

```

182   \@noitemerr
183   \fi}

```

`\addpenalty`

```

184 </2ekernel>
185 <latexrelease>\IncludeInRelease{2015/01/01}%
186 <latexrelease>           {\addpenalty}{\addpenalty}%
187 <*2ekernel | latexrelease>

```

Fix provided by Donald (though the original fix was not good enough). In 2005 Plamen Tanovski discovered that this fix wasn't good enough either as the `\vskip` kept getting bigger if several `\addpenalty` commands followed each other. Donald kindly send a new fix.

```

188 \def\addpenalty#1{%
189   \ifvmode
190     \if@minipage
191     \else
192       \if@nobreak
193       \else
194         \ifdim\lastskip=\z@
195         \penalty#1\relax
196         \else
197         \@tempskipb\lastskip

```

We have to make sure the final `\vskip` seen by  $\TeX$  is the correct one, namely `\@tempskipb`. However we may have to adjust for `\prevdepth` when placing the penalty but that should not affect the skip we pass on to  $\TeX$ .

```

198     \begingroup
199     \@tempskipa\@tempskipb
200     \advance \@tempskipb
201     \ifdim\prevdepth>\maxdepth\maxdepth\else

```

If `\prevdepth` is `-1000pt` due to `\nointerlineskip` we better not add it!

```

202     \ifdim \prevdepth = -\@m\p@ \z@ \else \prevdepth \fi
203     \fi
204     \vskip -\@tempskipb
205     \penalty#1%
206     \ifdim\@tempskipa=\@tempskipb

```

Do nothing if the `\prevdepth` check made no adjustment.

```

207     \else

```

Combine the `prevdepth` adjustment into a single skip.

```

208     \advance\@tempskipb -\@tempskipa
209     \vskip \@tempskipb
210     \fi

```

The final skip is always the specified length.

```

211     \vskip \@tempskipa
212     \endgroup
213     \fi
214     \fi
215     \fi
216   \else
217     \@noitemerr
218   \fi}%

```

\vspace  
\@vspace  
\@vspacer

The new code for these commands depends on the following facts:

- The value of prevdepth is changed only when a box or rule is created and added to a vertical list;
- The value of prevdepth is used only when a box is created and added to a vertical list;
- The value of prevdepth is always local to the building of one vertical list.

## 17.6 Horizontal space (and breaks)

`\nobreakdashes` This idea is borrowed from the `amsmath` package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as `-`, `--`, or `---`).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final `\nobreak`).

Note that even if it is not followed by a `'-`, it still leaves `vmode` and sets the `spacefactor`; so use it carefully!

```

280 \DeclareRobustCommand{\nobreakdashes}{%
281   \leavevmode
282   \toks@{}}%
283 \def\reserved@a##1{\toks@\expandafter{\the\toks@-}}%
284   \futurelet\@let@token \reserved@b}%
285 \def\reserved@b  {\ifx\@let@token -%
286   \expandafter\reserved@a
287   \else
288   \setbox\z@ \hbox{\the\toks@\nobreak}%
289   \unhbox\z@
290   \spacefactor\sfcode'\-
291   \fi}%
292 \futurelet\@let@token \reserved@b
293 }

```

`\nobreakspace` This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active `~` to expand to it since `\@xobeysp`

this is the documented behaviour of `~`. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the L<sup>A</sup>T<sub>E</sub>X internal commands.

The braces in the definition of `~` are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep `\@xobeysp` as it is widely used; so here it is let to the non-robust command `\nobreakspace` .

```
294 \DeclareRobustCommand{\nobreakspace}{%
295   \leavevmode\nobreak\ }
296 \catcode '\~=13
297 \def~{\nobreakspace{}}
298 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname
```

`\,` Used in paragraph mode produces a `\thinspace`. It has the ordinary definition in math mode. Useful for quotes inside quotes, as in ‘‘`\,`‘Foo’, he said.’’

```
299 \DeclareRobustCommand{\,}{%
300   \relax\ifmmode\mskip\thinmuskip\else\thinspace\fi
301 }
```

`\@` Placed before a ‘.’, makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting `spacefactor` to 1000.

```

15   \LaTeX\kern.15em2$_{\textstyle\varepsilon}$}}
16 </2kernel)
```

# File k

## lfiles.dtx

### 19 File Handling

The following user commands are defined in this part:

<code>\document</code>	<code>(ie \begin{document})</code>	Reads in the .AUX files and <code>\catcode</code> 's @ to 12.
<code>\nofiles</code>		Suppresses all file output by setting <code>\@filesw</code> false.
<code>\includeonly</code>	<code>{\NAME1, ... ,\NAMEn}</code>	Causes only parts NAME1, ... ,NAMEn to be read by their <code>\include</code> commands. Works by setting <code>partsw</code> true and setting <code>\@partlist</code> to NAME1, ... ,NAMEn.
<code>\include</code>	<code>{\NAME}</code>	Does an <code>\input</code> NAME unless <code>\@partsw</code> is true and NAME is not in <code>\@partlist</code> . If <code>\@filesw</code> is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.
<code>\input</code>	<code>{\NAME}</code>	The same as TeX's <code>\input</code> , except it allows optional braces around the file name. In $\text{\LaTeX} 2_{\epsilon}$ , it also avoids the primitive 'missing file' error, if the file can not be found.
<code>\IfFileExists</code>	<code>{\NAME}{\then}{\else}</code>	If the file exists on the system, execute <i>then</i> otherwise execute <i>else</i> .
<code>\InputIfFileExists</code>	<code>{\NAME}{\then}{\else}</code>	If the file exists on the system, execute <i>then</i> and input NAME otherwise execute <i>else</i> .

```
1 (*2kernel)
2 \message{files,}
```

VARIABLES, SWITCHES AND INTERNAL COMMANDS:

<code>\@mainaux</code>	:	Output file number for main .AUX file.
<code>\@partaux</code>	:	Output file number for current part's .AUX file.
<code>\@auxout</code>	:	Either <code>\@mainout</code> or <code>\@partout</code> , depending on which .AUX file output goes to.
<code>\@input{foo}</code>	:	If file foo exists, then <code>\input</code> 's it, otherwise types a warning message.
<code>@filesw</code>	:	Switch – set false if no .AUX, .TOC, .IDX etc files are to be written
<code>@partsw</code>	:	Set true by a <code>\includeonly</code> command.
<code>\@partlist</code>	:	Set to the argument of the <code>\includeonly</code> command.
<code>\cp@FOO</code>	:	The checkpoint for <code>\include</code> 'd file FOO.TEX, written by <code>\@writeckpt</code> at the end of file FOO.AUX

```

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old fonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```

38 \process@table
39 \let\glb@currsizel@empty %% Force math initialization.

40 \normalsize
41 \everypar{}%

```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L<sup>A</sup>T<sub>E</sub>X2.0x and plain T<sub>E</sub>X.)

```

42 \ifx\normalsfcodes\@empty
43   \ifnum\sfcode'\.=\@m
44     \let\normalsfcodes\frenchspacing
45   \else
46     \let\normalsfcodes\nonfrenchspacing
47   \fi
48 \fi

```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of `\language` at this point.

```

49 \ifx\document@default@language\m@ne
50   \chardef\document@default@language\language
51 \fi

```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```

52 \@noskipsecfalse

53 \let \@refundefined \relax

```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```

54 \let\AtBeginDocument\@firstofone
55 \@begindocumenthook

```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts are group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn[]` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```

56 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
57 \global\maxdepth\maxdepth
58 \global\let\@begindocumenthook\@undefined
59 \ifx\@listfiles\@undefined
60   \global\let\@filelist\relax
61   \global\let\@addtofilelist\@gobble
62 \fi

```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```

63 \gdef\do##1{\global\let ##1\@notprerr}%
64 \@preamblecmds

```

The next line saves tokens and also allows `\@nodocument` to be used directly to trap preamble errors.

```

65 \global\let \@nodocument \relax

```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```

66 \global\let\do\noexpand

```

Use of `\AtBeginDocument` hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

```

257 {\filename@area\filename@base}{\filename@ext}}}%
258 \reserved@a
259 \fi}

```

`\@obsoletefile` For compatibility with L<sup>A</sup>T<sub>E</sub>X 2.09 document styles, we distribute files called `article.sty`, `book.sty`, `report.sty`, `slides.sty` and `letter.sty`. These use the command `\@obsoletefile`, which produces a warning message.

```

260 \def\@obsoletefile#1#2{%
261 \@latex@warning@no@line{inputting '#1' instead of obsolete '#2'}}
262 \@onlypreamble\@obsoletefile

```

## 19.2 Listing files

`\@filelist` A list of files input so far. The initial value of `\@gobble` eats the comma before the first file name.

```
263 \let\@filelist\@gobble
```

`\@addtofilelist` Add to the list of files input so far. This ‘real’ definition is only used for ‘cfg’ files during `initex`. An initial definition of `\@gobble` has already been set.

```
264 %\def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}
```

`\listfiles` A preamble command to cause `\end{document}` to list files input from the main file.

```

265 \def\listfiles{%
266 \let\listfiles\relax
267 \def\@listfiles##1##2##3##4##5##6##7##8##9\@{%
268 \def\reserved@d{\}%
269 \@tfor\reserved@c:=##1##2##3##4##5##6##7##8\do{%
270 \ifx\reserved@c\reserved@d
271 \edef\filename@area{ \filename@area}%
272 \fi}}%

273 \def\@dofilelist{%
274 \typeout{^^J *File List*}%
275 \@for\@currname:=\@filelist\do{%

```

```

276 \filename@parse\@currname
277 \edef\reserved@a{%
278   \filename@base.%
279   \ifx\filename@ext\relax tex\else\filename@ext\fi}%
280 \expandafter\let\expandafter\reserved@b
281   \csname ver@\reserved@a\endcsname
282 \expandafter\expandafter\expandafter\@listfiles\expandafter
283   \filename@area\filename@base\@
284 \typeout{%
285   \filename@area\reserved@a
286   \ifx\reserved@b\relax\else\@spaces\reserved@b\fi}}%
287 \typeout{ *****~^J}}

```

The \@filelist will be de-activated if \listfiles does not appear in the preamble. \begin{document} contains code equivalent to the following:

```

\AtBeginDocument{%
  \ifx\@listfiles\@undefined
    \let\@filelist\relax
    \let\@addtofilelist\@gobble
  \fi}
288 \@onlypreamble\listfiles

\@dofilelist
289 \let\@dofilelist\relax
290 </2ekernel>

```

## File 1

# ltoutenc.dtx

## 20 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OLM, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {t1enc.def}
\input {ot1enc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{<command>}{<encoding>}
                        [ <number> ] [ <default> ] {<commands>}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{\@xxxii l}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{<command>}{<encoding>}
                        [ <number> ] [ <default> ] {<commands>}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{<command>}{<encoding>}{<slot>}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{<command>}{<encoding>}{<slot>}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{<command>
                    {<encoding>}{<argument>}{<slot>}
```

This command declares a composite letter, for example in the T1 encoding `\'a` is slot 225, which is declared by:

```
\DeclareTextComposite{\'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{<command>
                             {<encoding>}{<argument>}{<text>}
```

For example, in the OT1 encoding  $\mathring{A}$  has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@ \ht\z@\advance\dimen@-1ex%
 \rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{<encoding>}{<command>}
```

For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{<encoding>}{<command>}{<text>}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{\'}{a}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\'}{\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{<command>}{<definition>}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction  $\frac{1}{4}$ ) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\Provide` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{<command>}{<definition>}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{<command>}{<encoding>}
\DeclareTextAccentDefault{<command>}{<encoding>}
```

are short for:

```
\DeclareTextCommandDefault{<command>}
      {\UseTextSymbol{<encoding>}{<command>}}
\DeclareTextCommandDefault[1]{<command>}
      {\UseTextAccent{<encoding>}{<command>}{#1}}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

## 20.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since \$ and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flacky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L<sup>A</sup>T<sub>E</sub>X will still find the encoding specific-definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L<sup>A</sup>T<sub>E</sub>X to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar} {T1}
\DeclareTextCommandDefault{\textdollar}
{\UseTextSymbol{TS1}\textdollaroldstyle}
```

## 20.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

## 20.3 Docstrip modules

This `.dtx` file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

T1	generates <code>t1enc.def</code> for the Cork encoding.
TS1	generates <code>ts1enc.def</code> for the Text Companion encoding.
TS1sty	generates <code>textcomp.sty</code> , package that sets up use of the Text Companion encoding.
OT1	generates <code>ot1enc.def</code> for Knuth's CM encoding.
OMS	generates <code>omsenc.def</code> for Knuth's math symbol encoding.
OML	generates <code>omlenc.def</code> for Knuth's math letters encoding.
OT4	generates <code>ot4enc.def</code> for the Polish extension to the OT1 encoding, created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete.
TU	generates <code>tuenc.def</code> for Unicode font encoding.
package	generates <code>fontenc.sty</code> for selecting encodings.
2ekernel	for the kernel commands.

## 20.4 Definitions for the kernel

### 20.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in `.def` files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1 (*2kernel)
2 \message{font encodings,}
   Far too many macros in one block here!
```

If you say:

```
\DeclareTextCommand
\ProvideTextCommand
\DeclareTextSymbol
   \@dec@text@cmd
\chardef@text@cmd
   \@changed@cmd
   \@changed@x
\TextSymbolUnavailable
   \@inmathwarn
   \DeclareTextCommand{\foo}{T1}...
```

then `\foo` is defined to be `\T1-cmd \foo \T1\foo`, where `\T1\foo` is *one* control sequence, not two! We then call `\newcommand` to define `\T1\foo`.

```
3 \def\DeclareTextCommand{%
4   \@dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
6   \@dec@text@cmd\providecommand}
7 \def\@dec@text@cmd#1#2#3{%
8   \expandafter\def\expandafter#2%
9     \expandafter{%
10      \csname#3-cmd\expandafter\endcsname
11      \expandafter#2%
12      \csname#3\string#2\endcsname
13    }%
14   \let\@ifdefinable\@rc@ifdefinable
15   \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `\@dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providecommand` (used just above) both handle the resetting of `\@ifdefinable` (following its disabling in `\@dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17   \let\@ifdefinable\@ifdefinable
18   \chardef
19 }
20 \def\DeclareTextSymbol#1#2#3{%
21   \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22 }
```

The declarations are only available before `\begin{document}`.

```
23 \@onlypreamble\DeclareTextCommand
24 \@onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is T1, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like  `$\copyright$`  work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `?\foo` if it is defined, and an error message otherwise.

When the encoding is changed from T1 to OT1, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

25 \def\@current@cmd#1{%
26   \ifx\protect\@typeset@protect
27     \@inmathwarn#1%
28   \else
29     \noexpand#1\expandafter\@gobble
30   \fi}

31 \def\@changed@cmd#1#2{%
32   \ifx\protect\@typeset@protect
33     \@inmathwarn#1%
34     \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
35       \expandafter\ifx\csname ?\string#1\endcsname\relax
36         \expandafter\def\csname ?\string#1\endcsname{%
37           \TextSymbolUnavailable#1%
38         }%
39     \fi
40     \global\expandafter\let
41       \csname\cf@encoding\string#1\expandafter\endcsname
42       \csname ?\string#1\endcsname
43     \fi
44     \csname\cf@encoding\string#1%
45       \expandafter\endcsname
46   \else
47     \noexpand#1%
48   \fi}

49 \gdef\TextSymbolUnavailable#1{%

```

```

50 \latex@error{%
51   Command \protect#1 unavailable in encoding \cf@encoding%
52 } \@eha}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\@empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```

53 \def\@inmathwarn#1{%
54   \ifmmode
55     \latex@warning{Command \protect#1 invalid in math mode}%
56   \fi}

```

`\DeclareTextCommandDefault` These define commands with encoding ?.

`\ProvideTextCommandDefault` Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```

57 \def\DeclareTextCommandDefault#1{%
58   \DeclareTextCommand#1?}

59 \def\ProvideTextCommandDefault#1{%
60   \ProvideTextCommand#1?}

61 \@onlypreamble\DeclareTextCommandDefault
62 %\@onlypreamble\ProvideTextCommandDefault

```

They require `\?-cmd` to be initialized as `\@changed@cmd`.

```

63 \expandafter\let\csname?-cmd\endcsname\@changed@cmd

```

`\DeclareTextAccent` This is just a disguise for defining a TeX `\accent` command.

```

64 \def\DeclareTextAccent#1#2#3{%
65   \DeclareTextCommand#1{#2}{\add@accent{#3}}}

66 \@onlypreamble\DeclareTextAccent

```

`\add@accent` To save space this code is shared between all text accents that are set using the `\accent` primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve `\setbox` operations which also inhibit the mechanism of the `\accent` primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementaion and its deficiencies, see pr/3160.

```

67 \def\add@accent#1#2{\hmode@bgroup

```

Turn off the group in `\UseTextSymbol` in case this is used inside the argument of `\add@accent`.

```
68 \let\hmode@start@before@group\@firstofone
69 \setbox\@tempboxa\hbox{#2%
```

When presetting the argument in a box we record its `\spacefactor` for later use after the accent got typeset. This way something like `\‘A` gets the spacefactor of A (i.e., 999) rather than the default value of 1000.

```
70 \global\mathchardef\accent@spacefactor\spacefactor}%
71 \accent#1 #2\egroup\spacefactor\accent@spacefactor}
```

Default definition for `\accent@spacefactor` prevents a horrible death of the above macro inside an unprotected `\edef`.

```
72 \let\accent@spacefactor\relax
```

```
\hmode@bgroup
```

```
73 \def\hmode@bgroup{\leavevmode\bgroup}
```

Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `\@text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
\DeclareTextCompositeCommand
\DeclareTextComposite
\@text@composite
\@text@composite@x
\@strip@args
```

```
#1 -> \@text@composite \T1\foo #1\@empty \@text@composite {...}
```

where `...` is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```
74 </2ekernel)
75 (latexrelease)\IncludeInRelease{2017/04/15}{\DeclareTextCompositeCommand}
76 (latexrelease) {test for undeclared accent}%
77 (*2ekernel | latexrelease)
78 \def\DeclareTextCompositeCommand#1#2#3#4{%

121 <latexrelease>\EndIncludeInRelease
122 <*2ekernel>

123 \<onlypreamble>\DeclareTextCompositeCommand

```

This all works because:

```
\@text@composite \T1\foo A\@empty \@text@composite {...}
```

expands to `\T1\foo-A` if `\T1\foo-A` has been defined, and `{...}` otherwise.

Note that `\@text@composite` grabs the first token of the argument and puts just that in the `csname`. This is so that `\'\{\textit{e}\}` will work—it checks whether `\T1\'-\textit` is defined (which presumably it isn't) and so expands to `{\accent 1 \textit{e}}`.

This trick won't always work, for example `\'\{\itshape e\}` will expand to (with spaces added for clarity):

```
\csname \string \T1\' - \string {\itshape e} \@empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use `\csname` lookups as a fast way of accessing composites.

This has an unfortunate 'misfeature' though, which is that in the T1 encoding, `\'\{aa}` produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the `\@empty` is used in `\@text@composite` so that accents will work even when the argument is empty. If you say `\'\{}` then this looks up `\T1\'-\@empty`, which ought to be `\relax`, and so all is well. If we didn't include the `\@empty`, then `\'\{}` would expand to:

```
\csname \string \T1\' - \string \endcsname
```

so the `\endcsname` would be `\string`'ed and the whole of the rest of the document would be put inside the `\csname`. This would not be good.

```

124 \def\@text@composite#1#2#3\@text@composite{%
125   \expandafter\@text@composite@x
126   \csname\string#1-\string#2\endcsname}

```

Originally the `\@text@composite@x` macro had two arguments and if `#1` was not `\relax` it was executed, otherwise `#2` was executed. All this happened within the `\ifx` code so that neither `#1` nor `#2` could have picked up any additional arguments from the input stream. This has now been changed using the typical `\@firstoftwo / \@secondoftwo` coding. This way the final expansion will happen without any `\else` or `\fi` intervening in the case that we need to get a further token from the input stream.

```
127 \def\@text@composite@x#1{%
128   \ifx#1\relax
129     \expandafter\@secondoftwo
130   \else
131     \expandafter\@firstoftwo
132   \fi
133   #1}
```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```
134 \catcode\z@=11\relax

135 \def\DeclareTextComposite#1#2#3#4{%
136   \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
137   \bgroup
138     \lccode\z@#4%
139     \lowercase{%
140   \egroup
141     \reserved@a ^^@}}

142 \catcode\z@=15\relax

143 \@onlypreamble\DeclareTextComposite
```

`\UseTextAccent` These fragile commands access glyphs from different encodings. They use grotty  
`\UseTextSymbol` low-level calls to the font selection scheme for speed, and in order to make sure  
`\@use@text@encoding` that `\UseTextSymbol` doesn't do anything which you're not allowed to do between  
 an `\accent` and its glyph.

For a detailed discussion of this reimplementaion and its deficiencies, see [pr/3160](#).

```
144 \def\UseTextAccent#1#2#3{%
145   \hmode@start@before@group
146   {%
```

Turn off the group in `\UseTextSymbol` in case this is used inside the arguments of `\UseTextAccent`.

```
147   \let\hmode@start@before@group\@firstofone
148   \let\@curr@enc\cf@encoding
149   \@use@text@encoding{#1}%
150   #2{\@use@text@encoding\@curr@enc#3}%
151   }}
```

```
152 \def\UseTextSymbol#1#2{%
153   \hmode@start@before@group
154   {%
155     \def\@wrong@font@char{\MessageBreak
156       for \noexpand\symbol'\string#2'}%
157     \@use@text@encoding{#1}%
```

```

158         #2%
159     }%
160 }
161 \def\@use@text@encoding#1{%
162     \edef\f@encoding{#1}%
163     \xdef\font@name{%
164         \csname\curr@fontshape/\f@size\endcsname}%
165     \pickup@font
166     \font@name
167     \@@enc@update}

```

`\hmode@start@before@group` The `\hmode@start@before@group` starts hmode and should be immediately followed by an explicit `{...}`. Its purpose is to ensure that hmode is started before this group is opened. Inside `\add@accent` and `\UseTextAccent` it is redefined to remove this group so that it doesn't conflict with the `\accent` primitive.

For a detailed discussion see pr/3160.

```
168 \let\hmode@start@before@group\leavevmode
```

`\DeclareTextSymbolDefault` Some syntactic sugar. Again, these should probably be optimized for speed.

```

\DeclareTextAccentDefault 169 \def\DeclareTextSymbolDefault#1#2{%
170     \DeclareTextCommandDefault#1{\UseTextSymbol{#2}#1}}
171 \def\DeclareTextAccentDefault#1#2{%
172     \DeclareTextCommandDefault#1{\UseTextAccent{#2}#1}}
173 \@onlypreamble\DeclareTextSymbolDefault
174 \@onlypreamble\DeclareTextAccentDefault

```

`\UndeclareTextCommand` This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
175 \def\UndeclareTextCommand#1#2{%
```

If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without eTeX we can't do anything about that).

```
176     \expandafter\ifx\csname#2\string#1\endcsname\relax
177     \else
```

Else: throw away that declaration.

```
178     \global\expandafter\let\csname#2\string#1\endcsname
179     \undefined
```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command `\foo` would look similar to `\T1-cmd \foo \T1\foo` (three tokens).

Of course, instead of T1 one could see a different encoding name; which one depends the encoding for which `\foo` was declared last.

Now assume we have just removed the declaration for `\foo` in T1 and the top-level of `\foo` expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset `\foo` within T1 instead of getting the default definition for `\foo`. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by ?.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like `\?-cmd \foo \?\foo` which is done by the following (readable?) code:

```

180 \expandafter\expandafter\expandafter
181 \ifx\expandafter\@thirdofthree#1\@undefined
182 \expandafter\gdef\expandafter#1\expandafter
183 {\csname ?-cmd\expandafter\endcsname\expandafter
184 #1\csname?\string#1\endcsname}%
185 \fi
186 \fi
187 }
188 \@onlypreamble\UndeclareTextCommand

```

### 20.4.2 Hyphenation

```

206 %}

```

### 20.4.3 Miscellania

`\a` The `\a` command is used to access the accent commands even when they have been redefined (for example by the `tabbing` environment). Its internal name is `\@tabacckludge`.

The `\string` within the `\csname` guards against something like `'` being active at the point of use.

```

207 \def\@tabacckludge#1{\expandafter\@changed@cmd
208 \csname\string#1\endcsname\relax}
209 \let\a=\@tabacckludge

```

### 20.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings

must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like `\ae` and `\ss`) or by the T<sub>E</sub>X Users Group Technical Working Group on multi-lingual typesetting (like `\th` and `\ng`) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like `\guillemotleft` and `\quotedblbase`). Unfortunately, this naming scheme won't work for all glyphs, since some names (like `\space`) are already used, and some (like `\endash`) are very likely to be defined by users. So we're now using the naming scheme of `\text` followed by the Adobe name, (like `\textendash` and `\textsterling`). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like `\textcompwordmark`). Sigh.

Some accents from OT1:

```
210 \DeclareTextAccentDefault{"}{OT1}
211 \DeclareTextAccentDefault{'}{OT1}
212 \DeclareTextAccentDefault{.}{OT1}
213 \DeclareTextAccentDefault{=}{OT1}
214 \DeclareTextAccentDefault{H}{OT1}
215 \DeclareTextAccentDefault{^}{OT1}
216 \DeclareTextAccentDefault{`}{OT1}
217 \DeclareTextAccentDefault{b}{OT1}
218 \DeclareTextAccentDefault{c}{OT1}
219 \DeclareTextAccentDefault{d}{OT1}
220 \DeclareTextAccentDefault{r}{OT1}
221 \DeclareTextAccentDefault{u}{OT1}
222 \DeclareTextAccentDefault{v}{OT1}
223 \DeclareTextAccentDefault{~}{OT1}
```

Some symbols from OT1:

```
224 %\DeclareTextSymbolDefault{\AA}{OT1}
225 \DeclareTextSymbolDefault{\AE}{OT1}
226 \DeclareTextSymbolDefault{\L}{OT1}
227 \DeclareTextSymbolDefault{\OE}{OT1}
228 \DeclareTextSymbolDefault{\O}{OT1}
229 %\DeclareTextSymbolDefault{\aa}{OT1}
230 \DeclareTextSymbolDefault{\ae}{OT1}
231 \DeclareTextSymbolDefault{\i}{OT1}
232 \DeclareTextSymbolDefault{\j}{OT1}

233 \DeclareTextSymbolDefault{\ij}{OT1}
234 \DeclareTextSymbolDefault{\IJ}{OT1}

235 \DeclareTextSymbolDefault{\l}{OT1}
236 \DeclareTextSymbolDefault{\oe}{OT1}
237 \DeclareTextSymbolDefault{\o}{OT1}
238 \DeclareTextSymbolDefault{\ss}{OT1}
239 \DeclareTextSymbolDefault{\textdollar}{OT1}
240 \DeclareTextSymbolDefault{\textemdash}{OT1}
241 \DeclareTextSymbolDefault{\textendash}{OT1}
242 \DeclareTextSymbolDefault{\textexclamdown}{OT1}
243 %\DeclareTextSymbolDefault{\texthyphenchar}{OT1}
244 %\DeclareTextSymbolDefault{\texthyphen}{OT1}
```

```

245 \DeclareTextSymbolDefault{\textquestiondown}{OT1}
246 \DeclareTextSymbolDefault{\textquotedblleft}{OT1}
247 \DeclareTextSymbolDefault{\textquotedblright}{OT1}
248 \DeclareTextSymbolDefault{\textquoteleft}{OT1}
249 \DeclareTextSymbolDefault{\textquoteright}{OT1}
250 \DeclareTextSymbolDefault{\textsterling}{OT1}

```

Some symbols from OMS:

```

251 \DeclareTextSymbolDefault{\textasteriskcentered}{OMS}
252 \DeclareTextSymbolDefault{\textbackslash}{OMS}
253 \DeclareTextSymbolDefault{\textbar}{OMS}
254 \DeclareTextSymbolDefault{\textbardbl}{OMS}
255 \DeclareTextSymbolDefault{\textbraceleft}{OMS}
256 \DeclareTextSymbolDefault{\textbraceright}{OMS}
257 \DeclareTextSymbolDefault{\textbullet}{OMS}
258 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
259 \DeclareTextSymbolDefault{\textdagger}{OMS}
260 \DeclareTextSymbolDefault{\textparagraph}{OMS}
261 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
262 \DeclareTextSymbolDefault{\textsection}{OMS}
263 \DeclareTextAccentDefault{\textcircled}{OMS}

```

Some symbols from OML:

```

264 \DeclareTextSymbolDefault{\textless}{OML}
265 \DeclareTextSymbolDefault{\textgreater}{OML}
266 \DeclareTextAccentDefault{\t}{OML}

```

Some defaults we can fake.

The interface for defining `\copyright` changed, it used to use `\expandafter` to add braces at the appropriate points.

```

267 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
268 % \expandafter\def\expandafter
269 %           \copyright\expandafter{\expandafter{\copyright}}

270 \DeclareTextCommandDefault{\textasciicircum}{\~{}}
271 \DeclareTextCommandDefault{\textasciitilde}{\~{}}
272 \DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
273 \DeclareTextCommandDefault{\textunderscore}{%
274   \leavevmode \kern.06em\vbox{\hrule\@width.3em}}

275 \DeclareTextCommandDefault{\textvisiblespace}{%
276   \mbox{\kern.06em\vrule \@height.3ex}%
277   \vbox{\hrule \@width.3em}%
278   \hbox{\vrule \@height.3ex}}

```

Using `\fontdimen3` in the next definition is some sort of a kludge (since it is the interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since there it is zero).

```

279 \DeclareTextCommandDefault{\textellipsis}{%
280   .\kern\fontdimen3\font
281   .\kern\fontdimen3\font
282   .\kern\fontdimen3\font}

283 %\DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
284 \DeclareTextCommandDefault{\textregistered}{\textcircled{%
285   \check@mathfonts\fontsize\sf@size\z@\math@fontsfalse\selectfont R}}

```

```

286 \DeclareTextCommandDefault{\texttrademark}{\textsuperscript{TM}}
287 \DeclareTextCommandDefault{\SS}{SS}

288 \DeclareTextCommandDefault{\textordfeminine}{\textsuperscript{a}}
289 \DeclareTextCommandDefault{\textordmasculine}{\textsuperscript{o}}

```

#### 20.4.5 Math material

Some commands can be used in both text and math mode:

```

290 \DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textdollar\fi}
291 \DeclareRobustCommand{\{ }{\ifmmode\lbrace\else\textbraceleft\fi}
292 \DeclareRobustCommand{\} }{\ifmmode\rbrace\else\textbraceright\fi}
293 \DeclareRobustCommand{\P }{\ifmmode\mathparagraph\else\textparagraph\fi}
294 \DeclareRobustCommand{\S }{\ifmmode\mathsection\else\textsection\fi}
295 \DeclareRobustCommand{\dag }{\ifmmode{\dagger}\else\textdagger\fi}
296 \DeclareRobustCommand{\ddag }{\ifmmode{\ddagger}\else\textdaggerdbl\fi}

```

For historical reasons `\copyright` needs `{ }` around the definition in maths.

```

297 \DeclareRobustCommand{\_ }{%
298   \ifmmode\nfss@text{\textunderscore}\else\textunderscore\fi}
299 \DeclareRobustCommand{\copyright }{%
300   \ifmmode{\nfss@text{\textcopyright}}\else\textcopyright\fi}
301 \DeclareRobustCommand{\pounds }{%
302   \ifmmode\mathsterling\else\textsterling\fi}

303 \DeclareRobustCommand{\dots }{%
304   \ifmmode\mathellipsis\else\textellipsis\fi}

305 \let\ldots\dots

```

Default definition of the commabelow accent.

```

306 </2ekernel>
307 <latexrelease>\IncludeInRelease{2015/10/01}{\textcommabelow}{comma accent}%
308 <*2ekernel | latexrelease>
309 \DeclareTextCommandDefault\textcommabelow[1]
310   {\hmode@bgroup\oalign{\null#1\cr\hidewidth\raise-.31ex
311     \hbox{\check@mathfonts\fontsize\ssf@size\z@
312       \math@fontsfalse\selectfont,}\hidewidth}\egroup}
313 <latexrelease>\EndIncludeInRelease
314 </2ekernel | latexrelease>
315 <latexrelease>\IncludeInRelease{0000/00/00}{\textcommabelow}{comma accent}%
316 <latexrelease>\let\textcommabelow@undefined
317 <latexrelease>\expandafter

358 (latexrelease)\EndIncludeInRelease

```

## 20.5 Definitions for the OT1 encoding

The definitions for the ‘T<sub>E</sub>X text’ (OT1) encoding.

Declare the encoding.

```

359 (*OT1)
360 \DeclareFontEncoding{OT1}{-}{-}

```

Declare the accents.

```

361 \DeclareTextAccent{"}{OT1}{127}
362 \DeclareTextAccent{'}{OT1}{19}
363 \DeclareTextAccent{.}{OT1}{95}
364 \DeclareTextAccent{=}{OT1}{22}
365 \DeclareTextAccent{\~}{OT1}{94}
366 \DeclareTextAccent{\`}{OT1}{18}
367 \DeclareTextAccent{\^}{OT1}{126}
368 \DeclareTextAccent{\H}{OT1}{125}
369 \DeclareTextAccent{\u}{OT1}{21}
370 \DeclareTextAccent{\v}{OT1}{20}
371 \DeclareTextAccent{\r}{OT1}{23}

```

Some accents have to be built by hand: Note that `\oalign` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

372 \DeclareTextCommand{\b}{OT1}[1]
373   {\hmode\bgroup\o@lign{\relax#1\crrc\hidewidth\ltx@sh@ft{-3ex}%
374     \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
375 \DeclareTextCommand{\c}{OT1}[1]
376   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent24 #1%
377     \else{\oalign{\unhbox\z@\crrc\hidewidth\char24\hidewidth}}\fi}
378 \DeclareTextCommand{\d}{OT1}[1]
379   {\hmode\bgroup
380     \o@lign{\relax#1\crrc\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

381 \DeclareTextSymbol{\AE}{OT1}{29}
382 \DeclareTextSymbol{\OE}{OT1}{30}
383 \DeclareTextSymbol{\O}{OT1}{31}
384 \DeclareTextSymbol{\ae}{OT1}{26}
385 \DeclareTextSymbol{\i}{OT1}{16}
386 \DeclareTextSymbol{\j}{OT1}{17}
387 \DeclareTextSymbol{\oe}{OT1}{27}
388 \DeclareTextSymbol{\o}{OT1}{28}
389 \DeclareTextSymbol{\ss}{OT1}{25}
390 \DeclareTextSymbol{\textemdash}{OT1}{124}
391 \DeclareTextSymbol{\textendash}{OT1}{123}

```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```

392 %\DeclareTextSymbol{\textexclamdown}{OT1}{60}
393 %\DeclareTextSymbol{\textquestiondown}{OT1}{62}
394 \DeclareTextCommand{\textexclamdown}{OT1}{!'}
395 \DeclareTextCommand{\textquestiondown}{OT1}{?'}
396 \DeclareTextSymbol{\textthyphenchar}{OT1}{'\-}
397 %\DeclareTextSymbol{\textthyphen}{OT1}{'\-}
398 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
399 \DeclareTextSymbol{\textquotedblright}{OT1}{93}
400 \DeclareTextSymbol{\textquoteleft}{OT1}{94}
401 \DeclareTextSymbol{\textquoteright}{OT1}{95}

```

Some symbols which are faked from others:

```

402 % \DeclareTextCommand{\aa}{OT1}
403 %   {\accent23a}
404 \DeclareTextCommand{\L}{OT1}
405   {\leavevmode\setbox\z@\hbox{L}\hb@xt@\wd\z@{\hss\@xxxii L}}
406 \DeclareTextCommand{\l}{OT1}
407   {\hmode\bgroup\@xxxii l\egroup}
408 % \DeclareTextCommand{\AA}{OT1}
409 %   {\leavevmode\setbox\z@\hbox{h}\dimen@ht\z@\advance\dimen@-1ex%
410 %     \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

In the OT1 encoding  $\text{\AA}$  has a hand-crafted definition, so we have here the first recorded explicit use of `\DeclareTextCompositeCommand`.

```

411 \DeclareTextCompositeCommand{\r}{OT1}{A}
412   {\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
413     \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```

414 \DeclareTextCommand{\ij}{OT1}{%

```

```

415 \nobreak\hskip\z@skip i\kern-0.02em j\nobreak\hskip\z@skip}
416 \DeclareTextCommand{\IJ}{OT1}{%
417 \nobreak\hskip\z@skip I\kern-0.02em J\nobreak\hskip\z@skip}

```

In the OT1 encoding, £ and \$ share a slot.

```

418 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
419 \ifdim \fontdimen\@ne\font >\z@
420 \slshape
421 \else
422 \upshape
423 \fi
424 \char'\$\egroup}

425 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
426 \ifdim \fontdimen\@ne\font >\z@
427 \itshape
428 \else
429 \fontshape{ui}\selectfont
430 \fi
431 \char'\$\egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with `i` compatible with their use with the T1 encoding; this enables them to become true L<sup>A</sup>T<sub>E</sub>X internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

432 \DeclareTextComposite{\.}{OT1}{i}{'\i}
433 \DeclareTextComposite{\.}{OT1}{i}{'\i}
434 \DeclareTextCompositeCommand{\' }{OT1}{i}{\@tabacckludge'\i}
435 \DeclareTextCompositeCommand{\' }{OT1}{i}{\@tabacckludge'\i}
436 \DeclareTextCompositeCommand{\^ }{OT1}{i}{\^'\i}
437 \DeclareTextCompositeCommand{\^ }{OT1}{i}{\^'\i}

```

T1 encoding is given more extensive set of overloads for `\c`. But here we just adjust `\c{g}`.

```

438 \ifx\textcommaabove\undefined\else
439 \DeclareTextCompositeCommand{\c}{OT1}{g}{\textcommaabove{g}}
440 \fi
441 </OT1>

```

## 20.6 Definitions for the T1 encoding

The definitions for the ‘Extended T<sub>E</sub>X text’ (T1) encoding.

Declare the encoding.

```

442 <{*T1}
443 \DeclareFontEncoding{T1}{-}{}

```

Declare the accents.

```

444 \DeclareTextAccent{\' }{T1}{0}
445 \DeclareTextAccent{\' }{T1}{1}
446 \DeclareTextAccent{\^ }{T1}{2}
447 \DeclareTextAccent{\^ }{T1}{3}
448 \DeclareTextAccent{\^ }{T1}{4}
449 \DeclareTextAccent{\H }{T1}{5}

```

```

450 \DeclareTextAccent{\r}{T1}{6}
451 \DeclareTextAccent{\v}{T1}{7}
452 \DeclareTextAccent{\u}{T1}{8}
453 \DeclareTextAccent{\=} {T1}{9}
454 \DeclareTextAccent{\.}{T1}{10}

```

Some accents have to be built by hand. Note that `\oalign` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

455 \DeclareTextCommand{\b}{T1}[1]
456   {\hmode\bgroup\o@lign{\relax#1\crr\hidewidth\ltx@sh@ft{-3ex}%
457     \vbox to.2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
458 \DeclareTextCommand{\c}{T1}[1]
459   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent11 #1%
460     \else\oalign{\unhbox\z@\crr
461       \hidewidth\char11\hidewidth}}\fi}
462 \DeclareTextCommand{\d}{T1}[1]
463   {\hmode\bgroup
464     \o@lign{\relax#1\crr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
465 \DeclareTextCommand{\k}{T1}[1]
466   {\hmode\bgroup\oalign{\null#1\crr\hidewidth\char12}\egroup}
467 \DeclareTextCommand{\textogonekcentered}{T1}[1]
468   {\hmode\bgroup\oalign{%
469     \null#1\crr\hidewidth\char12\hidewidth}\egroup}

```

Some symbols are constructed.

Slot 24 contains a small circle intended for construction of these two glyphs.

```

470 \DeclareTextCommand{\textperthousand}{T1}
471   {\%\char 24 } % space or 'relax as delimiter?
472 \DeclareTextCommand{\textpertenthousand}{T1}
473   {\%\char 24\char 24 } % space or 'relax as delimiter?

```

For Maltese, `\Hwithstroke` and `\hwithstroke` are needed.

```

474 \DeclareTextCommand{\Hwithstroke}{T1}
475   {%
476     \hmode\bgroup
477     \vphantom{H}%
478     \sbox\z@{H}%
479     \oalign{%
480       H\cr
481       \hidewidth
482       \vrule
483         height \dimexpr 0.7\ht\z@+0.1ex\relax
484         depth -0.7\ht\z@
485         width 0.8\wd\z@
486       \hidewidth\cr
487     }%
488     \egroup
489   }
490 \DeclareTextCommand{\hwithstroke}{T1}
491   {%
492     \hmode\bgroup
493     \vphantom{h}%
494     \sbox\z@{h}%
495     \oalign{%

```

```

496     h\cr
497     \kern0.075\wd\z@
498     \vrule
499         height \dimexpr 0.7\ht\z@+0.1ex\relax
500         depth  -0.7\ht\z@
501         width  0.4\wd\z@
502     \hidewidth\cr
503 }%
504 \egroup
505 }

```

Declare the text symbols.

```

## 20.7 Definitions for the OMS encoding

The definitions for the ‘ $\TeX$  math symbol’ (OMS) encoding. Even though this is meant to be a math font, it includes some of the standard  $\LaTeX$  text symbols.

Declare the encoding.

```

692 (*OMS)
693 \DeclareFontEncoding{OMS}{-}{-}

```

Declare the symbols. Note that slot 13 has in places been named `\Orb`: please root out and destroy this impolity wherever you find it!

```

694 \DeclareTextSymbol{\textasteriskcentered}{OMS}{3} % "03
695 \DeclareTextSymbol{\textbackslash}{OMS}{110} % "6E
696 \DeclareTextSymbol{\textbar}{OMS}{106} % "6A
697 \DeclareTextSymbol{\textbardbl}{OMS}{107} % "6B
698 \DeclareTextSymbol{\textbraceleft}{OMS}{102} % "66
699 \DeclareTextSymbol{\textbraceright}{OMS}{103} % "67
700 \DeclareTextSymbol{\textbullet}{OMS}{15} % "0F
701 \DeclareTextSymbol{\textdaggerdbl}{OMS}{122} % "7A
702 \DeclareTextSymbol{\textdagger}{OMS}{121} % "79
703 \DeclareTextSymbol{\textparagraph}{OMS}{123} % "7B
704 \DeclareTextSymbol{\textperiodcentered}{OMS}{1} % "01
705 \DeclareTextSymbol{\textsection}{OMS}{120} % "78
706 \DeclareTextSymbol{\textbigcircle}{OMS}{13} % "0D
707 \DeclareTextCommand{\textcircled}{OMS}[1]{\hmode@bgroup
708 \oalign{%
709 \hfil \raise .07ex\hbox {\upshape#1}\hfil \crcr
710 \char 13 % "0D
711 }%
712 \egroup}
713 </OMS>

```

## 20.8 Definitions for the OML encoding

The definitions for the ‘ $\TeX$  math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard  $\LaTeX$  text symbols.

Declare the encoding.

```

714 (*OML)
715 \DeclareFontEncoding{OML}{-}{-}

```

Declare the symbols.

```

716 \DeclareTextSymbol{\textless}{OML}{'\<}

```

```

717 \DeclareTextSymbol{\textgreater}{OML}{'\>}
718 \DeclareTextAccent{\t}{OML}{127} % "7F
719 \end{OML}

```

## 20.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘T<sub>E</sub>X text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The L<sup>A</sup>T<sub>E</sub>X support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources `ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip`;

Font files `ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip`.

Declare the encoding.

```

720 (*OT4)
721 \DeclareFontEncoding{OT4}{}{}
722 \DeclareFontSubstitution{OT4}{cmr}{m}{n}

```

Declare the accents.

```

723 \DeclareTextAccent{"}{OT4}{127}
724 \DeclareTextAccent{'}{OT4}{19}
725 \DeclareTextAccent{\.}{OT4}{95}
726 \DeclareTextAccent{=} {OT4}{22}
727 \DeclareTextAccent{\^}{OT4}{94}
728 \DeclareTextAccent{\'}{OT4}{18}
729 \DeclareTextAccent{\~}{OT4}{126}
730 \DeclareTextAccent{\H}{OT4}{125}
731 \DeclareTextAccent{\u}{OT4}{21}
732 \DeclareTextAccent{\v}{OT4}{20}
733 \DeclareTextAccent{\r}{OT4}{23}

```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```

734 \DeclareTextCommand{\k}{OT4}[1]{%
735   \TextSymbolUnavailable{\k{#1}}#1}

```

In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

736 \DeclareTextCommand{\b}{OT4}[1]
737   {\hmode@bgroup\o@lign{\relax#1\crr\hidewidth\ltx@sh@ft{-3ex}%
738     \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
739 \DeclareTextCommand{\c}{OT4}[1]
740   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent24 #1%
741     \else\oalign{\unhbox\z@\crr\hidewidth\char24\hidewidth}}\fi}
742 \DeclareTextCommand{\d}{OT4}[1]
743   {\hmode@bgroup
744     \o@lign{\relax#1\crr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

745 \DeclareTextSymbol{\AE}{OT4}{29}
746 \DeclareTextSymbol{\OE}{OT4}{30}
747 \DeclareTextSymbol{\O}{OT4}{31}
748 \DeclareTextSymbol{\L}{OT4}{138}
749 \DeclareTextSymbol{\ae}{OT4}{26}

```

```

750 \DeclareTextSymbol{\guillemetleft}{OT4}{174}
751 \DeclareTextSymbol{\guillemetright}{OT4}{175}
752 % old Adobe names
753 \DeclareTextSymbol{\guillemotleft}{OT4}{174}
754 \DeclareTextSymbol{\guillemotright}{OT4}{175}

755 \DeclareTextSymbol{\i}{OT4}{16}
756 \DeclareTextSymbol{\j}{OT4}{17}
757 \DeclareTextSymbol{\l}{OT4}{170}
758 \DeclareTextSymbol{\o}{OT4}{28}
759 \DeclareTextSymbol{\oe}{OT4}{27}
760 \DeclareTextSymbol{\quotedblbase}{OT4}{255}
761 \DeclareTextSymbol{\ss}{OT4}{25}
762 \DeclareTextSymbol{\textendash}{OT4}{124}
763 \DeclareTextSymbol{\textendash}{OT4}{123}
764 \DeclareTextSymbol{\textexclamdown}{OT4}{60}
765 %\DeclareTextSymbol{\texthyphenchar}{OT4}{'\-}
766 %\DeclareTextSymbol{\texthyphen}{OT4}{'\-}
767 \DeclareTextSymbol{\textquestiondown}{OT4}{62}
768 \DeclareTextSymbol{\textquotedblleft}{OT4}{92}
769 \DeclareTextSymbol{\textquotedblright}{OT4}{'\"}
770 \DeclareTextSymbol{\textquoteleft}{OT4}{'\'}
771 \DeclareTextSymbol{\textquoteright}{OT4}{'\'}

```

Definition for Å as in OT1:

```

772 \DeclareTextCompositeCommand{\r}{OT4}{A}
773   {\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
774   \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

In the OT4 encoding, £ and \$ share a slot.

```

775 \DeclareTextCommand{\textdollar}{OT4}{\hmode@bgroup
776   \ifdim \fontdimen\@ne\font >\z@
777     \slshape
778   \else
779     \upshape
780   \fi
781   \char'\$\egroup}
782 \DeclareTextCommand{\textsterling}{OT4}{\hmode@bgroup
783   \ifdim \fontdimen\@ne\font >\z@
784     \itshape
785   \else
786     \fontshape{ui}\selectfont
787   \fi
788   \char'\$\egroup}

```

Declare the composites.

```

789 \DeclareTextComposite{\k}{OT4}{A}{129}
790 \DeclareTextComposite{\'}{OT4}{C}{130}
791 \DeclareTextComposite{\k}{OT4}{E}{134}
792 \DeclareTextComposite{\'}{OT4}{N}{139}
793 \DeclareTextComposite{\'}{OT4}{S}{145}
794 \DeclareTextComposite{\'}{OT4}{Z}{153}
795 \DeclareTextComposite{.}{OT4}{Z}{155}
796 \DeclareTextComposite{\k}{OT4}{a}{161}
797 \DeclareTextComposite{\'}{OT4}{c}{162}
798 \DeclareTextComposite{\k}{OT4}{e}{166}

```

```

799 \DeclareTextComposite{\'}{OT4}{n}{171}
800 \DeclareTextComposite{\'}{OT4}{s}{177}
801 \DeclareTextComposite{\'}{OT4}{z}{185}
802 \DeclareTextComposite{\.}{OT4}{z}{187}
803 \DeclareTextComposite{\'}{OT4}{0}{211}
804 \DeclareTextComposite{\'}{OT4}{o}{243}
805 </OT4>

```

## 20.10 Definitions for the TS1 encoding

```

806 <*TS1>
807 \DeclareFontEncoding{TS1}{-}{}
808 \DeclareFontSubstitution{TS1}{cmr}{m}{n}

```

Some accents have to be built by hand. Note that `\oalign` and `\o@lign` must be inside a group.

```

809 \DeclareTextCommand{\capitalcedilla}{TS1}[1]
810   {\hmode@bgroup
811     \oalign{\null#1\cr cr\hidewidth\char11\hidewidth}\egroup}
812 \DeclareTextCommand{\capitalogonek}{TS1}[1]
813   {\hmode@bgroup
814     \oalign{\null#1\cr cr\hidewidth\char12\hidewidth}\egroup}

```

Accents for capital letters.

These commands can be used by the end user either directly or through definitions of the type

```
\DeclareTextCompositeCommand{\'}{T1}{X}{\capitalacute X}
```

None of the latter definitions are provided by default, since they are probably rarely used.

”00 = 0

```

815 \DeclareTextAccent{\capitalgrave}{TS1}{0}
816 \DeclareTextAccent{\capitalacute}{TS1}{1}
817 \DeclareTextAccent{\capitalcircumflex}{TS1}{2}
818 \DeclareTextAccent{\capitaltilde}{TS1}{3}
819 \DeclareTextAccent{\capitaldieresis}{TS1}{4}
820 \DeclareTextAccent{\capitalhungarumlaut}{TS1}{5}
821 \DeclareTextAccent{\capitalring}{TS1}{6}
822 \DeclareTextAccent{\capitalcaron}{TS1}{7}

```

”08 = 8

```

823 \DeclareTextAccent{\capitalbreve}{TS1}{8}
824 \DeclareTextAccent{\capitalmacron}{TS1}{9}
825 \DeclareTextAccent{\capitaldotaccent}{TS1}{10}

```

Tie accents.

The tie accent was borrowed from the `cmmi` font. The `tc` fonts now provide four tie accents, the first two are done in the classical way with assymetric glyphs hanging out of their boxes; the new ties are centered in their boxes like all other accents. They need a name: please tell us if you know what to call them.

” =

```

826 \DeclareTextAccent{\t}{TS1}{26}
827 \DeclareTextAccent{\capitaltie}{TS1}{27}
828 \DeclareTextAccent{\newtie}{TS1}{28}
829 \DeclareTextAccent{\capitalnewtie}{TS1}{29}

```

Compound word marks.

The text companion fonts contain two compound word marks of different heights, one has `cap_height`, the other `asc_height`.

```
830 \DeclareTextSymbol{\textcapitalcompwordmark}{TS1}{23}
831 \DeclareTextSymbol{\textascendercompwordmark}{TS1}{31}
```

The text companion symbols.

```
832 \DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
"10 = 16
833 \DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
834 \DeclareTextSymbol{\texttwelveudash}{TS1}{21}
835 \DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}
"18 = 24
836 \DeclareTextSymbol{\textleftarrow}{TS1}{24}
837 \DeclareTextSymbol{\textrightarrow}{TS1}{25}
"20 = 32
838 \DeclareTextSymbol{\textblank}{TS1}{32}
839 \DeclareTextSymbol{\textdollar}{TS1}{36}
840 \DeclareTextSymbol{\textquotesingle}{TS1}{39}
"28 = 40
841 \DeclareTextSymbol{\textasteriskcentered}{TS1}{42}
```

Note that '054 is a comma and '056 is a full stop: these make numbers using oldstyle digits easier to input.

```
842 \DeclareTextSymbol{\textdblhyphen}{TS1}{45}
843 \DeclareTextSymbol{\textfractionsolidus}{TS1}{47}
```

Oldstyle digits.

```
"30 = 48
844 \DeclareTextSymbol{\textzerooldstyle}{TS1}{48}
845 \DeclareTextSymbol{\textoneoldstyle}{TS1}{49}
846 \DeclareTextSymbol{\texttwooldstyle}{TS1}{50}
847 \DeclareTextSymbol{\textthreeoldstyle}{TS1}{51}
848 \DeclareTextSymbol{\textfouroldstyle}{TS1}{52}

## 20.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package `fontspec` as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted from the `inputenc` UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to L<sup>A</sup>T<sub>E</sub>X LICR commands.

A few additional names for character which were supported in the original `fontspec` version of this file have also been added, even though they are not currently in the default `inputenc` UTF-8 declarations.

```
946 <*TU>
```

In the base interface the Unicode encoding is always known as TU. But we parameterise the encoding name to allow for modelling differences in Unicode support by different fonts.

```
947 \providecommand\UnicodeEncodingName{TU}
```

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then abort this file, switching back to T1 encoding.

```

948 \begingroup\expandafter\expandafter\expandafter\endgroup
949 \expandafter\ifx\csname XeTeXrevision\endcsname\relax
950 \begingroup\expandafter\expandafter\expandafter\endgroup
951 \expandafter\ifx\csname directlua\endcsname\relax

```

Not LuaTeX or XeTeX, abort with a warning.

```

## 21 Package files

This file now also contains some packages that provide access to the more specialised encodings.

### 21.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding FOO, the package looks to see if the encoding FOO has already been declared. If it has not, the file `fooenc.def` is loaded. The default encoding is set to be FOO.

In addition the package at the moment contains extra code to extend the `\@uclclist` (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```

1423 (*package)

    Here we define a macro that extends the \@uclclist if needed and afterwards
    turns itself in a noop.
1424 \def\update@uclc@with@cyrillic{%
1425 \expandafter\def\expandafter\@uclclist\expandafter

1450 \CYRYO\cyr\yu\CYRYU\cyr\z\CYRZ\cyr\zdsc\CYRZDSC\cyr\zh\CYRZH
1451 \cyr\zhdsc\CYRZHDSC}%
1452 \let\update@uclc@with@cyrillic\relax
1453 }

```

Here we process each option:

```

1454 \DeclareOption*{%
1455   \let\encodingdefault\CurrentOption
1456   \edef\reserved@f{%
1457     \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}}%
1458   \reserved@f
1459   \InputIfFileExists\reserved@f
1460     {}{\PackageError{fontenc}%
1461       {Encoding file ‘\reserved@f’ not found.%
1462         \MessageBreak
1463         You might have misspelt the name of the encoding}%
1464       {Necessary code for this encoding was not
1465         loaded.\MessageBreak
1466         Thus calling the encoding later on will
1467         produce further error messages.}}%
1468   \let\reserved@f\relax

```

In case the current encoding is one of a list of known cyrillic ones we extend the \@uclclist:

```

1469 \expandafter\in@\expandafter{\CurrentOption}%
1470                               {T2A,T2B,T2C,X2,LCY,OT2}%
1471 \ifin@

```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the \@uclclist gets unnecessarily big, slowing down the processing at runtime.

```

1472   \expandafter\in@\expandafter\cyr\expandafter
1473     {\@uclclist}%
1474   \ifin@
1475   \else
1476     \update@uclc@with@cyrillic
1477   \fi
1478 \fi
1479 }

```

```

1480 \ProcessOptions*
1481 \fontencoding\encodingdefault\selectfont

```

To save some space we get rid of the macro extending the \@uclclist (might have happened already).

```

1482 \let\update@uclc@with@cyrillic\relax

```

Finally we pretend that the fontenc package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose

package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```
1483 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
1484 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
1485 \global\let@ifl@ter@@\@ifl@ter
1486 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@}
1487 \endpackage
```

## 21.2 The textcomp package

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

```
1488 \textsty
```

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

**#5** those TS1 symbols that are also in the ISO-Adobe character set; without `\textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non- $\TeX$  world provide only this subset.

**#4** = #5 + `\texteuro`. Most newer fonts provide this.

**#3** = #4 + `\textomega`. Can also be described as  $TS1 \cap (ISO-Adobe \cup MacRoman)$ . (Except for the missing "currency".)

**#2** = #3 + `\textestimated` + `\textcurrency`. Can also be described as  $TS1 \cap Adobe-Western-2$ . This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

**#1** = TS1 without `\textcircled` and `\t`. These two glyphs are often not implemented and if their kernel defaults are changed commands like `\copyright` unnecessarily fail.

**#0** = full TS1

And here a summary to go in the transcript file:

```
1489 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
1490 \space\space 5 = only ISO-Adobe without
1491 \string\textcurrency\MessageBreak
1492 \space\space 4 = 5 + \string\texteuro\MessageBreak
1493 \space\space 3 = 4 + \string\textohm\MessageBreak
1494 \space\space 2 = 3 + \noexpand\textestimated+
1495 \string\textcurrency\MessageBreak
1496 \space\space 1 = TS1 - \noexpand\textcircled-
1497 \string\t\MessageBreak
1498 \space\space 0 = TS1 (full)\MessageBreak
```

```

1499   Font families with sub-encoding setting implement\MessageBreak
1500   only a restricted character set as indicated.\MessageBreak
1501   Family '?' is the default used for unknown fonts.\MessageBreak
1502   See the documentation for details\@gobble}

```

`\DeclareEncodingSubset` An encoding subset to which a font family belongs is declared by the command `\DeclareEncodingSubset` that takes the major encoding as the first argument (e.g., `TS1`), the family name as the second argument (e.g., `cmr`), and the subset encoding id as a third, (e.g., `0` for `cmr`).

The default encoding subset to use when nothing is known about the current font family is named `?`.

```

1503 \def\DeclareEncodingSubset#1#2#3{%
1504   \@ifundefined{#1:#2}%
1505     {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
1506     {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
1507   \@namedef{#1:#2}{#3}}
1508 \@onlypreamble\DeclareEncodingSubset

```

The options for the package are the following:

**safe** for unknown font families enables only symbols that are also in the ISO-Adobe character set; without “currency”, which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

**euro** enables the “safe” symbols plus the `\texteuro` command. Most newer fonts provide this.

**full** enables all `TS1` commands; useful only with fonts like `EC` or `CM bright`.

**almostfull** same as “full”, except that `\textcircled` and `\t` are *not* redefined from their defaults to avoid that commands like `\copyright` suddenly no longer work.

**force** ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

`\iftc@forced` Switch used to implement the `force` option

```

1509 \newif\iftc@forced   \tc@forcedfalse

```

This is implemented by defining the default subset:

```

1510 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
1511 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
1512 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}
1513 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}

```

The default is “almostfull” which means that old documents will work except that `\textcircled` and `\t` will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn’t implement these glyphs.

The “force” option simply sets the switch to true.

```

1514 \DeclareOption{force}{\tc@forcedtrue}

```

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

```

1515 \def\tc@errorwarn{\PackageError}
1516 \DeclareOption{warn}{\gdef\tc@errorwarn#1#2#3{\PackageWarning{#1}{#2}}}
1517 \ExecuteOptions{almostfull}
1518 \ProcessOptions\relax

```

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: `#2` and `#5` of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs `#3#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```

1519 \iftc@forced

```

If the “force” option was given we always use the default for testing against.

```

1520 \def\CheckEncodingSubset#1#2#3#4#5{%
1521   \ifnum #4>%
1522     0\csname #2:\endcsname
1523     \relax
1524   \expandafter\@firstoftwo
1525   \else
1526   \expandafter\@secondoftwo
1527   \fi
1528   {#1{#2}}{#3}%
1529   #5%
1530 }

```

In normal circumstances the test is a bit more complicated: first check if there exists a macro `\langle arg2 \rangle: \langle current-family \rangle` and if so use that value to test against, otherwise use the default to test against.

```

1531 \else
1532 \def\CheckEncodingSubset#1#2#3#4#5{%
1533   \ifnum #4>%
1534     \expandafter\ifx\csname #2:\f@family\endcsname\relax
1535     0\csname #2:\endcsname
1536     \else
1537     \csname #2:\f@family\endcsname
1538     \fi
1539   \relax
1540   \expandafter\@firstoftwo
1541   \else
1542   \expandafter\@secondoftwo

```

```

1543 \fi
1544   {#1{#2}}{#3}%
1545   #5%
1546 }
1547 \fi

```

`\tc@subst`

```

1548 \def\tc@subst#1{%
1549   \tc@errorwarn{textcomp}% % should be latex error if general
1550   {Symbol \string#1 not provided by\MessageBreak
1551     font family \f@family\space
1552     in TS1 encoding.\MessageBreak Default family used instead}\@eha
1553   \bgroup\fontfamily\textcompsubstdefault\selectfont#1\egroup
1554 }

```

`\textcompsubstdefault`

```

1555 \def\textcompsubstdefault{cmr}

```

`\tc@error` `\tc@error` is going to be used in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

```

1556 % error commands take argument:
1557 % #1 symbol to be used
1558 \def\tc@error#1{%
1559   \PackageError{textcomp}% % should be latex error if general
1560   {Accent \string#1 not provided by\MessageBreak
1561     font family \f@family\space
1562     in TS1 encoding}\@eha
1563 }

```

`\tc@fake@euro` `\tc@fake@euro` is an example of a “fake” definition to use in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a “C” with a “=”.

```

1564 \def\tc@fake@euro#1{%
1565   \leavevmode
1566   \PackageInfo{textcomp}{Faking \noexpand#1for font family
1567     \f@family\MessageBreak in TS1 encoding}%
1568   \valign{##\cr
1569     \vfil\hbox to 0.07em{\dimen@\f@size\p@
1570       \math@fontsfalse
1571       \fontsize{.7\dimen@}\z@\selectfont=\hss}%
1572     \vfil\cr%
1573     \hbox{C}\crrcr
1574   }%
1575 }

```

`\tc@check@symbol` These are two abbreviations that we use below to check symbols and accents in  
`\tc@check@accent` TS1. Only there to save some space, e.g., we can then write

```

\DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}

```

to ensure that `\textcurrency` is only typeset if the current font has a TS1 subset id of less than 3. Otherwise `\tc@error` is called telling the user that for this font family `\textcurrency` is not available.

```

1576 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
1577 \def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}

```

We start with the commands that are “safe” and which can be unconditionally set up, first the accents. . .

```

1578 \DeclareTextAccentDefault{\capitalcedilla}{TS1}
1579 \DeclareTextAccentDefault{\capitalogonek}{TS1}
1580 \DeclareTextAccentDefault{\capitalgrave}{TS1}

1759 \DeclareTextCommandDefault{\textsurd}%
1760   {\tc@check@symbol2\textsurd}

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1761 \DeclareTextCommandDefault{\textcircled}
1762   {\CheckEncodingSubset\UseTextAccent{TS1}%
1763   {\UseTextAccent{OMS}}1\textcircled}
1764 \DeclareTextCommandDefault{\t}
1765   {\CheckEncodingSubset\UseTextAccent{TS1}%
1766   {\UseTextAccent{OML}}1\t}

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimised for this encoding (and not for the default encoding, see section 20.2).

```

1767 \input{ts1enc.def}

```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L<sup>A</sup>T<sub>E</sub>X which will prevent the usage of the TS1 versions (see section 20.1 above). So we better get rid of them:

```
1768 \UndeclareTextCommand{\textsterling}{OT1}
1769 \UndeclareTextCommand{\textdollar} {OT1}
```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```
1770 %\UndeclareTextCommand{\textsterling}{OT4}
1771 %\UndeclareTextCommand{\textdollar} {OT4}
```

From the T1 encoding there are two candidates for removal: %<sub>0</sub> and %<sub>00</sub> since these are both constructed from % followed by a tiny ‘o’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in %<sub>0</sub> rather than %<sub>00</sub> while the real glyph (at least for \textperthousand) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for \textperthousand but keeping the one for \textpertenthousand. This will have the effect that with Computer Modern fonts everything will come out (although %<sub>00</sub> and %<sub>000</sub> are not taken from the same physical font) and with PostScript fonts %<sub>00</sub> will come out correctly while %<sub>000</sub> will most likely look like %<sub>0</sub> — which is probably an improvement over just getting a single ‘<sub>0</sub>’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ \textpertenthousand.

```
1772 \UndeclareTextCommand{\textperthousand}{T1}
1773 %\UndeclareTextCommand{\textpertenthousand}{T1}
```

### 21.2.1 Supporting oldstyle digits

```
1774 \DeclareRobustCommand\oldstylenums[1]{%
1775   \begingroup
1776   \ifmmode
1777     \mathgroup\symletters #1%
1778   \else
1779     \CheckEncodingSubset\@use@text@encoding{TS1}%
1780     {\PackageWarning{textcomp}%
1781       {Oldstyle digits unavailable for
1782         family \f@family.\MessageBreak
1783         Lining digits used instead}}%
1784     \tw@{#1}%
1785   \fi
1786 \endgroup
1787 }
```

### 21.2.2 Subset encoding defaults

For many font families commonly used in the T<sub>E</sub>X world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```
1788 \iftc@forced \else
```

Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

```

## ltxcounts.dtx

### 22 Counters and Lengths

Commands for defining and using counters. This file defines:

<code>\newcounter</code>	To define a new counter.
<code>\setcounter</code>	To set the value of counters.
<code>\addtocounter</code>	Increase the counter #1 by the number #2.
<code>\stepcounter</code>	Increase a counter by one.
<code>\refstepcounter</code>	Increase a counter by one, also setting the value used by <code>\label</code> .
<code>\value</code>	For accessing the value of the counter as a T <sub>E</sub> X number (as opposed to <code>\the&lt;counter&gt;</code> which expands to the <i>printed</i> representation of <code>&lt;counter&gt;</code> )
<code>\arabic</code>	<code>\arabic{&lt;counter&gt;}</code> : 1, 2, 3, ...
<code>\roman</code>	<code>\roman{&lt;counter&gt;}</code> : i, ii, iii, ...
<code>\Roman</code>	<code>\Roman{&lt;counter&gt;}</code> : I, II, III, ...
<code>\alph</code>	<code>\alph{&lt;counter&gt;}</code> : a, b, c, ...
<code>\Alph</code>	<code>\Alph{&lt;counter&gt;}</code> : A, B, C, ...
<code>\fnsymbol</code>	<code>\fnsymbol{&lt;counter&gt;}</code> : *, †, ‡, ...
<code>\counterwithin</code>	<code>\counterwithin{&lt;counter&gt;}{&lt;within-counter&gt;}</code> : Resets <code>&lt;counter&gt;</code> whenever <code>&lt;within-counter&gt;</code> is stepped. Also redefines <code>\the&lt;counter&gt;</code> command to produce <code>\the&lt;within-counter&gt;.\arabic{&lt;counter&gt;}</code> . Star form omits redefining the print representation.
<code>\counterwithout</code>	<code>\counterwithout{&lt;counter&gt;}{&lt;within-counter&gt;}</code> : Removes <code>&lt;counter&gt;</code> from the reset list of <code>&lt;within-counter&gt;</code> . Also redefines <code>\the&lt;counter&gt;</code> command to produce <code>\arabic{&lt;counter&gt;}</code> . Star form omits redefining the print representation.

1 (\*2ekernel)

#### 22.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

<code>\c@foo</code>	Contains the counter's numerical value. It is defined by <code>\newcount\foocounter</code> .
<code>\thefoo</code>	Macro that expands to the printed value of <code>\foocounter</code> . For example, if sections are numbered within chapters, and section headings look like Section II-3. The Nature of Counters then <code>\thesection</code> might be defined by: <code>\def\thesection</code> <code>{\@Roman{\c@chapter}-\@arabic{\c@section}}</code>
<code>\p@foo</code>	Macro that expands to a printed 'reference prefix' of counter foo. Any <code>\ref</code> to a value created by counter foo will produce the expansion of <code>\p@foo\thefoo</code> when the <code>\label</code> command is executed. See file <code>ltxref.dtx</code> for an extension of this mechanism.
<code>\cl@foo</code>	List of counters to be reset when foo stepped. Has format <code>\@elt{countera}\@elt{counterb}\@elt{counterc}</code> .

### NOTE:

`\thefoo` and `\p@foo` *must* be defined in such a way that `\edef\bar{\thefoo}` or `\edef\bar{\p@foo}` defines `\bar` so that it will evaluate to the counter value at the time of the `\edef`, even after `\foocounter` and any other counters have been changed. This will happen if you use the standard commands `\@arabic`, `\@Roman`, etc.

The following commands are used to define and modify counters.

`\refstepcounter{<foo>}`

Same as `\stepcounter`, but it also defines `\@currentreference` so that a subsequent `\label{<bar>}` command causes `\ref{<bar>}` to generate the current value of counter `<foo>`.

`\@definecounter{<foo>}`

Initializes counter `<foo>` (with empty reset list), defines `\p@foo` and `\thefoo` to be null. Also adds `<foo>` to `\cl@ckpt` – the reset list of a dummy counter `@ckpt` used for taking checkpoints for the `\include` system.

`\@addtoreset{<foo>}{<bar>}` : Adds counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\@removefromreset{<foo>}{<bar>}` : Removes counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\setcounter` `\setcounter{<foo>}{<val>}` : Globally sets `\foocounter` equal to `<val>`.

```
2 \def\setcounter#1#2{%
3   \@ifundefined{c@#1}%
4     {\@nocounterr{#1}}%
5     {\global\csname c@#1\endcsname#2\relax}}
```

`\addtocounter` `\addtocounter{<foo>}{<val>}` Globally increments `\foocounter` by `<val>`.

```
6 \def\addtocounter#1#2{%
7   \@ifundefined{c@#1}%
8     {\@nocounterr{#1}}%
9     {\global\advance\csname c@#1\endcsname #2\relax}}
```

`\newcounter` `\newcounter{<newctr>}[<oldctr>]` Defines `<newctr>` to be a counter, which is reset when counter `<oldctr>` is stepped. If `<newctr>` already defined produces ‘`c@newctr` already defined’ error.

```
10 \def\newcounter#1{%
11   \expandafter\@ifdefinable \csname c@#1\endcsname
12     {\@definecounter{#1}}%
13   \@ifnextchar[{\@newctr{#1}}{-}]}
```

`\value` `\value{<ctr>}` produces the value of counter `<ctr>`, for use with a `\setcounter` or `\addtocounter` command.

```
14 \def\value#1{\csname c@#1\endcsname}
```

`\@newctr`

```
15 \def\@newctr#1[#2]{%
16   \@ifundefined{c@#2}{\@nocounterr{#2}}{\@addtoreset{#1}{#2}}}
```

`\stepcounter` `\stepcounterfoo` Globally increments counter `\c@F00` and resets all subsidiary counters.

```
17 \def\stepcounter#1{%
```

```

18 \addtocounter{#1}\@ne
19 \begingroup
20 \let\@elt\@stpelt
21 \csname cl@#1\endcsname
22 \endgroup}

```

`\@stpelt` Rather than resetting the “within” counter to zero we set it to  $-1$  and then run `\stepcounter` that moves it to 0 and also initiates resetting the next level down.

125 Y\or Z\else\@ctrerr\fi}

```

`\@fnsymbol` Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.

This macro is another example of an ever recurring problem in  $\TeX$ : Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an `\edef` or `\write` where an `\ifmode` test would be executed prematurely. Hence in the implementation below, `\@fnsymbol` is not robust in itself but the parts doing the actual typesetting are.

In the case of `\@fnsymbol` we make use of the robust command `\TextOrMath` which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a `\relax` token if run under regular  $\TeX$ , which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use  $e\TeX$  as engine for  $L^A\TeX$  (as recommended) this unfortunate side effect is not present.

```

126 </2ekernel>
127 <latexrelease>\IncludeInRelease{2015/01/01}{\@fnsymbol}{Use \TextOrMath}%
128 <*2ekernel | latexrelease>

147 <latexrelease> \or \ddagger\ddagger \else\@ctrerr\fi}}%
148 <latexrelease>\EndIncludeInRelease
149 <*2ekernel>

```

`\TextOrMath` When using regular  $\TeX$ , we make this command robust so that it always selects the correct branch in an `\ifmode` switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic `\IeC` from `inputenc` but then it will have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell.

However, users of eTeX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eTeX but making sure not to permanently turn `\protected` into `\relax`.

```
150 </2ekernel>
151 <latexrelease>\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
152 <*2ekernel | latexrelease>
153 \begingroup\expandafter\expandafter\expandafter\endgroup
154 \expandafter\ifx\csname protected\endcsname\relax
```

In case of ordinary TeX we define `\TextOrMath` as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```
155 \DeclareRobustCommand\TextOrMath{%
156   \ifmmode \expandafter\@secondoftwo
157   \else \expandafter\@firstoftwo \fi}
158 \protected@edef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
159 \else
```

For eTeX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```
160 \protected\expandafter\def\csname TextOrMath\space\endcsname{%
161   \ifmmode \expandafter\@secondoftwo
162   \else \expandafter\@firstoftwo \fi}
163 \edef\TextOrMath#1#2{%
164   \expandafter\noexpand\csname TextOrMath\space\endcsname
165   {#1}{#2}}
166 \fi
167 </2ekernel | latexrelease>

\@settodim Clear the memory afterwards (which might be a lot).
18 \setbox\@tempboxa\box\voidb@x}
19 \def\settoheight{\@settodim\ht}
20 \def\settodepth {\@settodim\dp}
21 \def\settowidth {\@settodim\wd}

\@settopoint This macro takes the contents of the skip register that is supplied as its argument
and removes the fractional part to make it a whole number of points. This can be
used in class files to avoid values like 345.4666666pt when calculating a dimension.

22 \def\@settopoint#1{\divide#1\p@\multiply#1\p@}
23 (/2ekernel)
```

## File o

# ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of the L<sup>A</sup>T<sub>E</sub>X ‘New’ Font Selection Scheme.

**Warning:** The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

The ‘2ekernel’ code ensures that a `\usepackage{autofss1}` is essentially ignored if a ‘full’ format is being used that has picture mode already in the format. Note the `autofss2` loading is currently disabled.

```
1 (2ekernel)\expandafter\let\csname ver@autofss1.sty\endcsname\fmtversion
```

## 24 Preliminary macros

We define a number of macros that will be used later.

`\@nomath` `\@nomath` is used by most macros that will have no effect in math mode. It issues a warning message.

```
2 (*2ekernel)
3 \def\@nomath#1{\relax\ifmmode
4   \@font@warning{Command \noexpand#1invalid in math mode}\fi}
```

`\no@alphabet@error` The macro `\no@alphabet@error` is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The `\relax` at the beginning is necessary to prevent T<sub>E</sub>X from scanning too far in certain situations.

```
5 \gdef\no@alphabet@error#1{\relax \ifmmode
6   \@latex@error{Math\space alphabet\space identifier\space
7     \noexpand#1is\space undefined\space in\space math\space
8     version\space ‘\math@version’}%
9   {Your\space requested\space math\space alphabet\space
10    is\space undefined\space in\space the\space current\space
11    math\space version.^^JCheck\space the\space spelling\space
12    or\space use\space the\space \noexpand\SetMathAlphabet\space
13    command.}
14   \fi}
```

`\new@mathgroup` We also give a new name to `\newfam` and `\fam` to avoid verbal confusion (see the introduction).<sup>2</sup>

```
\mathgroup
15 %\def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@n}
16 \let\mathgroup\fam
17 %\let\newfam\new@mathgroup
18 \@onlypreamble\new@mathgroup
```

<sup>2</sup>For the same reason it seems advisable to `\let\fam` and `\newfam` equal to `\relax`, but this is commented out to retain compatibility to existing style files.

## 25 Macros for setting up the tables

`\DeclareFontShape` The macro `\DeclareFontShape` takes 6 arguments:

```
19 \def\DeclareFontShape{\begingroup
```

First we restore the catcodes of all characters used in the syntax.

```
20 \nfss@catcodes
```

We use `\expandafter \endgroup` to restore catcode in case something goes wrong with the argument parsing (suggested by Tim Van Zandt)

`\DeclareFontShape`

```
21 \expandafter\endgroup
22 \DeclareFontShape@}
23 \def\DeclareFontShape@#1#2#3#4#5#6{%
24 \expandafter\ifx\csname #1+#2\endcsname\relax
25 \latex@error{Font family ‘#1+#2’ unknown}\@eha
26 \else
27 \expandafter
28 \xdef\csname#1/#2/#3/#4\endcsname{\expandafter\noexpand
29 \csname #5\endcsname}%
30 \def\reserved@a{#6}%
31 \global
32 \expandafter\let\csname#5\endcsname\expandafter\endcsname
33 \ifx\reserved@a\@empty
34 \@empty
35 \else
36 \reserved@a
37 \fi
38 \fi
39 }
```

`\DeclareFixedFont` Define a direct font switch that avoids all overhead.

```
40 \def\DeclareFixedFont#1#2#3#4#5#6{%
41 \begingroup
42 \math@fontsfalse
43 \every@math@size{}%
44 \fontsize{#6}\z@
45 \usefont{#2}{#3}{#4}{#5}%
46 \global\expandafter\let\expandafter#1\the\font
47 \endgroup
48 }
```

`\do@subst@correction`

```
49 \def\do@subst@correction{%
50 \xdef\subst@correction{%
51 \font@name
52 \global\expandafter\font
53 \csname \curr@fontshape/\f@size\endcsname
54 \noexpand\fontname\font
55 \relax}%
```

Calling `\subst@correction` after the current group means calling it after we have loaded the substitution font which is done inside a group.

```
56 \aftergroup\subst@correction
57 }
```

`\DeclareFontFamily`

```
58 \def\DeclareFontFamily#1#2#3{%  
If we want fast checking for the encoding scheme we can just check for \T@. . being  
defined.  
59 % \@tempwafalse  
60 % \def\reserved@b{#1}%  
61 % \def\cdp@elt##1##2##3##4{\def\reserved@c{##1}%  
62 % \ifx\reserved@b\reserved@c \@tempwatrue\fi}%  
63 % \cdp@list  
64 % \if@tempswa  
65 % \ifundefined{T@#1}%  
66 %   {%  
67 %     \@latex@error{Encoding scheme ‘#1’ unknown}\@eha  
68 %   }%  
69 %   {%
```

Now we have to define the macro `\langle#1\rangle\langle#2\rangle` to contain `#3`. But since most of the time `#3` will be empty we use `\let` in a tricky way rather than a simple `\def` since this will save internal memory. We store the argument `#3` in a temporary macro `\reserved@a`.

```
70 \def\reserved@a{#3}%  
We compare \reserved@a with \@empty If these two are the same we \let the ‘extra’  
macro equal to \@empty which is not the same a doing a \let to \reserved@a  
— the latter would blow one extra memory location rather then reusing the one  
from \@empty.  
71 \global  
72 \expandafter\let\csname #1+#2\expandafter\endcsname  
73 \ifx \reserved@a\@empty  
74 \@empty  
75 \else \reserved@a  
76 \fi  
77 }%  
78 }
```

`\cdp@list` We initialize the code page list to be empty.

```
79 \let\cdp@list\@empty  
80 \@onlypreamble\cdp@list
```

`\cdp@elt`

```
81 \let\cdp@elt\relax  
82 \@onlypreamble\cdp@elt
```

`\DeclareFontEncoding`

```
83 \def\DeclareFontEncoding{%  
First we start with ignoring all blanks and newlines since every surplus space in  
the second or third argument will come out in a weird place in the document.  
84 \begingroup  
85 \nfss@catcodes  
86 \expandafter\endgroup  
87 \DeclareFontEncoding@}  
88 \@onlypreamble\DeclareFontEncoding
```

```

89 \def\DeclareFontEncoding#1#2#3{%
90   \expandafter
91   \ifx\csname T@#1\endcsname\relax
92     \def\cdp@elt{\noexpand\cdp@elt}%
93     \xdef\cdp@list{\cdp@list\cdp@elt{#1}%
94                   {\default@family}{\default@series}%
95                   {\default@shape}}%

```

To support encoding dependent commands (like accents) we initialise the command `\langle encoding\rangle-cmd` to be `\@changed@cmd`. (See `ltoutenc.dtx` for details.)

```

96     \expandafter\let\csname#1-cmd\endcsname\@changed@cmd
97   \else
98     \@font@info{Redeclaring font encoding #1}%
99   \fi
100  \global\@namedef{T@#1}{#2}%
101  \global\@namedef{M@#1}{\default@M#3}%

```

Keep a record of the last encoding being declared:

```

102  \xdef\LastDeclaredEncoding{#1}%
103  }
104  \@onlypreamble\DeclareFontEncoding@

```

`\LastDeclaredEncoding` The last encoding being declared by `\DeclareFontEncoding`.

```

105 \def\LastDeclaredEncoding{}

```

`\DeclareFontSubstitution`

```

106 \def\DeclareFontSubstitution#1#2#3#4{%
107   \expandafter
108   \ifx\csname T@#1\endcsname\relax
109     \@latex@error{Encoding scheme ‘#1’ unknown}\@eha
110   \else
111     \begingroup

```

We loop through the `\cdp@list` and rebuild it anew in `\toks@` thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in `\reserved@a` since it might just be `\LastDeclaredEncoding` that is passed as `#1`.

```

112     \edef\reserved@a{#1}%
113     \toks@{}%
114     \def\cdp@elt##1##2##3##4{%
115       \def\reserved@b{##1}%
116       \ifx\reserved@a\reserved@b

```

Here we use the new defaults but we use `##1` (i.e., the encoding name already stored previously) since we know that it is expanded.

```

117         \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
118       \else

```

If `\reserved@a` and `\reserved@b` differ then we simply copy from the old list to the new.

```

119         \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%
120       \fi}%
121     \cdp@list

```

```

122     \xdef\cdp@list{\the\toks@}%
123   \endgroup
124   \global
125   \@namedef{D@#1}{%
126     \def\default@family{#2}%
127     \def\default@series{#3}%
128     \def\default@shape{#4}%
129     }%
130   \fi
131 }
132 \@onlypreamble\DeclareFontSubstitution

```

`\DeclareFontEncodingDefaults`

```

133 \def\DeclareFontEncodingDefaults#1#2{%
134   \ifx\relax#1\else
135     \ifx\default@T\@empty\else
136       \@font@info{Overwriting encoding scheme text defaults}%
137     \fi
138     \gdef\default@T{#1}%
139   \fi
140   \ifx\relax#2\else
141     \ifx\default@M\@empty\else
142       \@font@info{Overwriting encoding scheme math defaults}%
143     \fi
144     \gdef\default@M{#2}%
145   \fi
146 }
147 \@onlypreamble\DeclareFontEncodingDefaults

```

`\default@T`

`\default@M`

```

148 \let\default@T\@empty
149 \let\default@M\@empty

```

`\DeclarePreloadSizes`

```

150 \def\DeclarePreloadSizes#1#2#3#4#5{%
151   \@ifundefined{T@#1}%
152   {\@latex@error{Encoding scheme ‘#1’ unknown}\@eha}%
153   {%

```

Don't know at the moment what this group here does!

```

154   \begingroup

```

We define a macro `\reserved@f`<sup>3</sup> that grabs the next *size* and loads the corresponding font. This is done by delimiting `\reserved@f`'s only argument by the token `,` (comma).

```

155     \def\reserved@f##1,{%

```

The end of the list will be detected when there are no more elements, i.e. when `\reserved@f`'s argument is empty. The trick used here is explained in Appendix D of the *T<sub>E</sub>Xbook*: if the argument is empty the `\if` will select the first clause and `\let \reserved@f equal to \relax`. (We use the `>` character here since it cannot appear in font file names.)

```

156     \if>##1>%

```

---

<sup>3</sup>We cannot use `\@tempa` since it is needed in `\pickup@font`.

```

157         \let\reserved@f\relax
158         \else

```

Otherwise, we define `\font@name` appropriately and call `\pickup@font` to do the work. Note that the requested `\curr@fontshape` combination must have been defined, or you will get an error. The definition of `\font@name` is carried out globally to be consistent with the rest of the code in this file.

```

159         \xdef\font@name{\csname#1/#2/#3/#4/##1\endcsname}%
160         \pickup@font

```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to `\relax`. This means that later on, when the font is first used, the macro `\define@newfont` is called again to execute the ‘extra’ macro for this font.

```

161         \global\expandafter\let\font@name\relax
162         \fi

```

Finally we call `\reserved@f` again to process the next *size*. If `\reserved@f` was `\let` equal to `\relax` this will end the macro.

```

163         \reserved@f}%

```

We finish with reinserting the list of sizes after the `\reserved@f` macro and appending an empty element so that the end of the list is recognized properly.

```

164     \reserved@f#5, ,%
165     \endgroup
166 }%
167 }

```

```

168 \@onlypreamble\DeclarePreloadSizes

```

`\ifmath@fonts` We need a switch to decide if we have to switch math fonts. For this purpose we provide `\ifmath@fonts` that can be set to true or false by the `\S@...` macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

```

169 \newif\ifmath@fonts \math@fontstrue

```

`\DeclareMathSizes` `\DeclareMathSizes` takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right `\S@...` macro.

```

170 \def\DeclareMathSizes{%
171   \@ifstar{\@DeclareMathSizes\math@fontsfalse}%
172   {\@DeclareMathSizes{}}%
173 \@onlypreamble\DeclareMathSizes

```

`\@DeclareMathSizes` This modification by Michael J. Downes on `comp.text.tex` on 2002/10/17 allows the user to have settings such as `\DeclareMathSizes{9.5dd}{9.5dd}{7.4dd}{6.6dd}`.

```

214 (*2ekernel)
215 \@onlypreamble\@DeclareMathSizes

```

## 26 Selecting a new font

### 26.1 Macros for the user

`\fontencoding` As we said in the introduction a font is described by four parameters. We first  
`\f@encoding` define macros to specify the wanted *family*, *series*, or *shape*. These are simply  
recorded in internal macros `\f@family`, `\f@series`, and `\f@shape`, resp. We use  
`\edef`'s so that the arguments can also be macros.

```

216 \DeclareRobustCommand\fontencoding[1]{%
217   \expandafter\ifx\csname T@#1\endcsname\relax
218     \@latex@error{Encoding scheme ‘#1’ unknown}\@eha
219   \else
220     \edef\f@encoding{#1}%
221     \ifx\cf@encoding\f@encoding

```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a `\selectfont` in-between we can save processing by making sure that `\enc@update` is `\relax`.

```

222     \let\enc@update\relax
223     \else

```

If current and new encoding differ we define the macro `\enc@update` to contain all updates necessary at `\selectfont` time.

```

224     \let\enc@update\@enc@update
225     \fi
226     \fi
227 }

```

`\@enc@update`

```

228 \def\@enc@update{%

```

When `\@enc@update` is executed `\f@encoding` holds the encoding name for the new encoding and `\cf@encoding` the name of the last active encoding.

We start by setting the init command for encoding dependent macros to `\@changed@cmd`.

```

229     \expandafter
230     \let
231     \csname\cf@encoding -cmd\endcsname
232     \@changed@cmd

```

Then we turn the one for the new encoding to `\@current@cmd` (see `ltoutenc.dtx` for further explanations).

```

233     \expandafter
234     \let
235     \csname\f@encoding-cmd\endcsname
236     \@current@cmd

```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```

237     \default@T
238     \csname T@\f@encoding\endcsname

```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```

239     \csname D@\f@encoding\endcsname
240     \let\enc@update\relax
241     \let\cf@encoding\f@encoding
242 }

```

`\enc@update` The default action in `\selectfont` is to do nothing.

```

243 \let\enc@update\relax

```

`\fontfamily`

```

\ffamily 244 \DeclareRobustCommand\fontfamily[1]{\edef\ffamily{#1}}

```

`\fontseries` 245 `\DeclareRobustCommand\fontseries[1]{\edef\ffseries{#1}}`

```

\ffseries 246 \DeclareRobustCommand\fontshape [1]{\edef\ffshape{#1}}

```

`\fontshape` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

`\ffshape`

```

247 \def\usefont#1#2#3#4{\fontencoding{#1}\fontfamily{#2}%
248     \fontseries{#3}\fontshape{#4}\selectfont
249     \ignorespaces}

```

`\linespread` The command `\linespread` changes the current `\baselinestretch` by calling `\set@fontsize`. The values for `\f@size` and `\f@baselineskip` will be left unchanged.

```
250 \DeclareRobustCommand\linespread[1]
251   {\set@fontsize{#1}\f@size\f@baselineskip}
```

`\fontsize` We also define a macro that allows to specify a size. In this case, however, we also need the value of `\baselineskip`. As the first argument to `\set@fontsize` we pass the current value of `\baselinestretch`. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using `\renewcommand`. If we would pass the internal `\f@linespread` such a change would be effectively overwritten by a size change.

```
252 \DeclareRobustCommand\fontsize[2]
253   {\set@fontsize\baselinestretch{#1}{#2}}
```

`\f@linespread` This macro holds the current internal value for `\baselinestretch`.

```
254 \let\f@family\@empty
255 \let\f@series\@empty
256 \let\f@shape\@empty
257 \let\f@size\@empty
258 \let\f@baselineskip\@empty
259 \let\f@linespread\@empty
```

`\cf@encoding`

```
260 \let\f@encoding\@empty
261 \let\cf@encoding\@empty
```

`\@defaultunits` The function `\@defaultunits` when wrapped around a dimen or skip assignment supplies default units. Usage:

```
\@defaultunits\dimen@=#1pt\relax\@nnil
```

Note: the `\relax` is *important*. Other units can be substituted for the ‘pt’ if desired.

We use `\remove@to@nnil` as an auxiliary macros for `\@defaultunits`. It just has to gobble the supplied default unit ‘pt’ or whatever, if it wasn’t used in the assignment.

```
262 \def\@defaultunits{\afterassignment\remove@to@nnil}
```

`\strip@pt` This macro strips the characters pt produced by using `\the` on a dimen register.

```
\rem@pt
263 \begingroup
264   \catcode‘P=12
265   \catcode‘T=12
266   \lowercase{
267     \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@.##2\fi}}
268   \expandafter\endgroup\x
269 \def\strip@pt{\expandafter\rem@pt\the}
```

`\mathversion` `\mathversion` takes the math *version* name as argument, defines `\math@version` appropriately and switches to the font selected forcing a call to `\glb@settings` if the *version* is known to the system.

```
270 \DeclareRobustCommand\mathversion[1]
271   {\@nomath\mathversion
```

```

272     \expandafter\ifx\csname mv@#1\endcsname\relax
273     \latex@error{Math version '#1' is not defined}\@eha\else
274     \edef\math@version{#1}%

```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting `\glb@currsz` to an invalid value since this will trigger the setup when the formula starts.

```

275     \gdef\glb@currsz{}%

```

When the scope of the current `\mathversion` ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is to do the setting only if the version really has changed after all. This might be interesting in case of `amstext` and `boldsymbol`.

```

276     \aftergroup\glb@settings
277     \fi}

```

If  $\TeX$  would support a hook just before the end of a formula (opposite of `\everymath` so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in  $\LaTeX$  the use of `$` (as the primitive  $\TeX$  command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a `$` couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct  $\TeX$  function must be hidden.

Anyway, since we don't have this and won't have it in  $\LaTeX 2_\epsilon$  we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks `\everymath` and `\everydisplay`. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

```

\frozen@everymath New internal names for \everymath and \everydisplay.
\frozen@everydisplay 278 \let\frozen@everymath\everymath
279 \let\frozen@everydisplay\everydisplay

\everymath Now we provide now user hooks that will be called in the frozen internals.
\everydisplay 280 \newtoks\everymath
281 \newtoks\everydisplay

\frozen@everymath Now we define the behaviour of the frozen hooks: first check the math setup then
call the user hook.
282 \frozen@everymath = {\check@mathfonts
283 \the\everymath}

\frozen@everydisplay Ditto for the display hook.
284 \frozen@everydisplay = {\check@mathfonts
285 \the\everydisplay}

\curr@math@size This holds locally the current math size.
286 \let\curr@math@size\@empty

```

## 26.2 Macros for loading fonts

- `\pickup@font` The macro `\pickup@font` which is used in `\selectfont` is very simple: if the font name is undefined (i.e. not known yet) it calls `\define@newfont` to load it.
- ```

287 \def\pickup@font{%
288   \expandafter \ifx \font@name \relax
289     \define@newfont
290     \fi}

```
- `\split@name` `\pickup@font` assumes that `\font@name` is set but it is sometimes called when `\f@family`, `\f@series`, `\f@shape`, or `\f@size` may have the wrong settings (see, e.g., the definition of `\getanddefine@fonts`). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define `\split@name` which takes the font name as a list of characters of `\catcode` 12 (without the backslash at the beginning) delimited by the special control sequence `\@nil`. This is not very complicated: we first ensure that `/` has the right `\catcode`
- ```

291 {\catcode'\/=12

```
- and define `\split@name` so that it will define our private `\f@encoding`, `\f@family`, `\f@series`, `\f@shape`, and `\f@size` macros.
- ```

292 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%
293                                     \def\f@family{#2}%
294                                     \def\f@series{#3}%
295                                     \def\f@shape{#4}%
296                                     \def\f@size{#5}}

```
- `\curr@fontshape` Abbreviation which may get removed again for speed.
- ```

297 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}

```
- `\define@newfont` Now we can tackle the problem of defining a new font.
- ```

298 \def\define@newfont{%

```
- We have already mentioned that the token list that `\split@name` will get as argument must not start with a backslash. To reach this goal we will set the `\escapechar` to `-1` so that the `\string` primitive will not generate an escape character. To keep this change local we open a group. We use `\begingroup` for this purpose since `\define@newfont` might be called in math mode, and an empty `\bgroup... \egroup` would add an empty Ord atom to the math list and thus affect the spacing.
- Also locally redefine `\typeout` so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.
- ```

299   \begingroup
300     \let\typeout\@font@info
301     \escapechar\m@ne

```
- Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four `\expandafter`’s so that `\font@name` is expanded first, then `\string`, and finally `\split@name`.
- ```

302     \expandafter\expandafter\expandafter
303       \split@name\expandafter\string\font@name\@nil

```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```

304 %   \expandafter\ifx
305 %       \csname\curr@fontshape\endcsname \relax
306 %   \try@load@fontshape % try always
307 %   \fi
308 \expandafter\ifx
309     \csname\curr@fontshape\endcsname \relax
310     \wrong@fontshape\else

```

To allow substitution we call the `curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```

311 %       \csname\curr@fontshape\endcsname
312 %       \extract@font\fi

```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```

313 \endgroup}

314 \def\try@load@fontshape{%
315     \expandafter
316     \ifx\csname \f@encoding+\f@family\endcsname\relax
317         \@font@info{Try loading font information for
318             \f@encoding+\f@family}%

```

We predefine this combination to be `\@empty` which means that next time we don't try again unnecessary in case we don't find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```

319     \global\expandafter\let
320     \csname\f@encoding+\f@family\endcsname\@empty

```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```

321     \nfss@catcodes
322     \let\nfss@catcodes\relax

```

For increased portability make the external filename monospace, but look for the (old style) mixed case filename if the first attempt fails.

On any monospace system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private `fd` files with lowercase names.

```

323     \edef\reserved@a{%
324         \lowercase{%
325             \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}%
326     \reserved@a\relax
327         {\@input@\f@encoding\f@family.fd}}%
328 \fi}

```

`\nfss@catcodes` This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```

\expandafter\def\expandafter\nfss@catcodes
\expandafter{\nfss@catcodes <additional settings>}

```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```
329 \def\nfss@catcodes{%
```

We start by making @ a letter and ignoring all blanks and newlines.

```
330     \makeatletter
331     \catcode'\ 9%
332     \catcode'\^^I9%
333     \catcode'\^^M9%
```

Then we set up \, {, }, # and % in case an .fd file is loaded during a verbatim environment.

```
334     \catcode'\\\z@
335     \catcode'\{\@ne
336     \catcode'\}\tw@
337     \catcode'\#6%
338     \catcode'\^7%
339     \catcode'\%14%
```

The we make sure that the important syntax parts have the right `\catcode`.

```
340     \@makeother\<%
341     \@makeother\>%
342     \@makeother\*%
343     \@makeother\.%
344     \@makeother\-%
345     \@makeother\/%
346     \@makeother\[%
347     \@makeother\]%
348     \@makeother\'%
349     \@makeother\'%
350     \@makeother\"%
351 }
```

`\DeclareErrorFont` Declare the last resort shape! We assume that in this fontshape there is a 10pt font but it doesn't really matter. We only loose one macro name if the assumption is false. But at least the font should be there!

```
352 \def\DeclareErrorFont#1#2#3#4#5{%
353     \xdef\error@fontshape{%
354         \noexpand\expandafter\noexpand\split@name\noexpand\string
355         \expandafter\noexpand\csname#1/#2/#3/#4/#5\endcsname
356         \noexpand\@nil}%
```

Initialize all those internal variables which may or may not have values in the first seconds of NFSS' bootstrapping process. Later on such values will be updated when an encoding is selected, etc.

We definitely don't want to set `\f@encoding`; we can set all the others since if they are left "blank" any selection would grap "error default values" as well. However, this probably should go also.

```
357 %     \gdef\f@encoding{#1}%
358     \gdef\default@family{#2}%
359     \gdef\default@series{#3}%
360     \gdef\default@shape{#4}%
361     \global\let\f@family\default@family
```

```

362     \global\let\f@series\default@series
363     \global\let\f@shape\default@shape
364     \gdef\f@size{#5}%
365     \gdef\f@baselineskip{#5pt}%
366 }
367 \@onlypreamble\DeclareErrorFont

```

`\wrong@fontshape` Before we come to the macro `\extract@font` we have to take care of unknown `\curr@fontshape` combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails  $\TeX$  will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```

368 \</2ekernel>
369 \<latexrelease>\IncludeInRelease{2015/01/01}{\wrong@fontshape}%
370 \<latexrelease>           {Font substitution in preamble}%
371 \<*2ekernel | latexrelease>
372 \def\wrong@fontshape{%
373     \csname D@f@encoding\endcsname % install defaults if in math

```

We remember the wanted `\curr@fontshape` combination which we will need in a moment.

```

374     \edef\reserved@a{\csname\curr@fontshape\endcsname}%
375     \ifx\last@fontshape\reserved@a
376         \errmessage{Corrupted NFSS tables}%
377         \error@fontshape
378     \else

```

Then we warn the user about the mess and set the shape to its default.

```

379     \let\f@shape\default@shape

```

If the combination is not known, try the default *series*.

```

380     \expandafter\ifx\csname\curr@fontshape\endcsname\relax
381         \let\f@series\default@series

```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```

382     \expandafter
383         \ifx\csname\curr@fontshape\endcsname\relax
384         \let\f@family\default@family

```

If we change the font family and we are in the preamble then the corresponding `.fd` file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in “NFSS tables corrupted”. After begin document that will not happen as all `.fd` files involved in substitution are loaded at `\begin{document}`.

```

385         \begingroup
386             \try@load@fontshape
387         \endgroup
388     \fi \fi
389 \fi

```

At this point a valid `\curr@fontshape` combination must have been found. We inform the user about this fact.

The `\expandafter\string` here stops  $\TeX$  adding the space that it usually puts after command names in messages. The similar construction with `\@undefined` just produces ‘undefined’, but saves a few tokens.

`\@wrong@font@char` is locally redefined in `\UseTextSymbol` from its normal (empty) definition, to report the symbol generating the font switch.

```
390 \font@warning{Font shape ‘\expandafter\string\reserved@a’
391 \expandafter@gobble\string\undefined\MessageBreak
392 using ‘\curr@fontshape’ instead\@wrong@font@char}%
393 \global\let\last@fontshape\reserved@a
```

We change `\@defaultsubs` to produce a warning at the end of the document.

The macro `\@defaultsubs` is initially `\relax` but gets changed here if some default font substitution happens. It is then executed in `\enddocument`.

```
394 \gdef\@defaultsubs{%
395 \font@warning{Some font shapes were not available, defaults
396 substituted.\@gobbletwo}}%
```

If we substitute a `\curr@fontshape` combination by the default one we don't want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally `\let` the macro corresponding to the wanted combination equal to its substitution. This requires the use of four `\expandafter`'s since `\csname... \endcsname` has to be expanded before `\reserved@a` (i.e. the requested combination), and this must happen before the `\let` is executed.

```
397 \global\expandafter\expandafter\expandafter\let
398 \expandafter\reserved@a
399 \csname\curr@fontshape\endcsname
```

Now we can redefine `\font@name` accordingly. This *must* be done globally since it might occur in the group opened by `\define@newfont`. If we would this definition were local the closing `\endgroup` there would restore the old meaning of `\font@name` and then switch to the wrong font at the end of `\selectfont` although the correct font was loaded.

```
400 \xdef\font@name{%
401 \csname\curr@fontshape/\f@size\endcsname}%
```

The last thing this macro does is to call `\pickup@font` again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```
402 \pickup@font}
403 </2ekernel | latexrelease>
404 <latexrelease>\EndIncludeInRelease
405 <latexrelease>\IncludeInRelease{0000/00/00}{\wrong@fontshape}%
406 <latexrelease> {Font substitution in preamble}%
407 <latexrelease>\def\wrong@fontshape{%
408 <latexrelease> \csname D@\f@encoding\endcsname
409 <latexrelease> \edef\reserved@a{\csname\curr@fontshape\endcsname}%
410 <latexrelease> \ifx\last@fontshape\reserved@a
411 <latexrelease> \errmessage{Corrupted NFSS tables}%
412 <latexrelease> \error@fontshape
413 <latexrelease> \else
414 <latexrelease> \let\f@shape\default@shape
415 <latexrelease> \expandafter\ifx\csname\curr@fontshape\endcsname\relax
416 <latexrelease> \let\f@series\default@series
417 <latexrelease> \expandafter
418 <latexrelease> \ifx\csname\curr@fontshape\endcsname\relax
419 <latexrelease> \let\f@family\default@family
420 <latexrelease> \fi \fi
```

```

421 (latexrelease) \fi
422 (latexrelease)   \@font@warning{Font shape
423 (latexrelease)     '\expandafter\string\reserved@a'
424 (latexrelease)     \expandafter\@gobble\string\@undefined
425 (latexrelease)     \MessageBreak
426 (latexrelease)     using '\curr@fontshape' instead\@wrong@font@char}%
427 (latexrelease) \global\let\last@fontshape\reserved@a
428 (latexrelease) \gdef\@defaultsubs{%
429 (latexrelease)   \@font@warning{Some font shapes were not available,
430 (latexrelease)     defaults substituted.\@gobbletwo}}%
431 (latexrelease) \global\expandafter\expandafter\expandafter\let
432 (latexrelease)   \expandafter\reserved@a
433 (latexrelease)   \csname\curr@fontshape\endcsname
434 (latexrelease) \xdef\font@name{%
435 (latexrelease)   \csname\curr@fontshape/\f@size\endcsname}%
436 (latexrelease) \pickup@font}
437 (latexrelease)\EndIncludeInRelease
438 (*2ekernel)

```

`\@wrong@font@char` Normally empty but redefined in `\UseTextSymbol` so that the Font shape undefined message can refer to the symbol causing the problem.

```
439 \let\@wrong@font@char\@empty
```

`\@@defaultsubs` See above.

```
\@defaultsubs 440 \let\@defaultsubs\relax
```

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the `TEXbook`, p. 382).

```
441 \def\strip@prefix#1>{}
```

## 27 Assigning math fonts to *versions*

`\install@mathalphabet` This is just another name for `\gdef` but we can redefine it if necessary later on.

```
442 \let\install@mathalphabet\gdef
```

`\math@fonts`

```
443 \let\math@fonts\@empty
```

`\select@group` `\select@group` has four arguments: the new *math alphabet identifier* (a control sequence), the *math group number*, the extra macro for math mode and the `\curr@fontshape` definition macro name. We first check if we are in math mode.

```
444 %\def\select@group#1#2#3{\relax\ifmmode
```

We do these things locally using `\begingroup` instead of `\bgroup` to avoid the appearance of an empty Ord atom on the math list.

```
445 % \begingroup
```

We set the math fonts for the *family* in question by calling `\getanddefine@fonts` in the correct environment.

```
446 % \escapechar\m@ne
```

```
447 % \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%
```

We globally select the math fonts...

```
448 % \globaldefs\@ne \math@fonts
```

... and close the group to restore `\globaldefs` and `\escapechar`.

```
449 % \endgroup
```

As long as no *size* or *version* change occurs the  $\langle\textit{math alphabet identifier}\rangle$  should simply switch to the installed *math group* instead of calling `\select@group` unnecessarily. So we globally redefine the first argument (the new  $\langle\textit{math alphabet identifier}\rangle$ ) to expand into a `\mathgroup` switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro. The original code for the end of `\select@group` was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the  $\langle\textit{math alphabet identifier}\rangle$  and then calling the new definition to switch to the wanted  $\langle\textit{math group}\rangle$ . Now we define the  $\langle\textit{math alphabet identifier}\rangle$  as a call to the `\use@mathgroup` command.

```
450 % \xdef#1{\noexpand\use@mathgroup\noexpand#2%
```

```
451 %         {\number\csname c@mv@\math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier `#1`, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for `#1` are not restored unless `#1` is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro `\mv@<version>` so that it calls `\getanddefine@fonts` directly in future as well. We use the macro `\extract@alph@from@version` to do this. It takes the math alphabet identifier `#1` and the math version macro as arguments.

```
452 % \expandafter\extract@alph@from@version
```

```
453 %     \csname mv@\math@version\expandafter\endcsname
```

```
454 %     \expandafter{\number\csname c@mv@\math@version\endcsname}}%
```

```
455 %     #1%
```

```
456 %     \stepcounter{mv@\math@version}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```
457 %\expandafter #1\fi}
```

```
\extract@alph@from@version We proceed to the definition of the macro \extract@alph@from@version. As stated above, it takes a math alphabet identifier and a math version macro (e.g. \mv@normal) as its arguments.
```

```
458 \def\extract@alph@from@version#1#2#3{%
```

To extract and replace the definition of math alphabet identifier `#3` in macro `#1` we have to recall how this definition looks like: Somewhere in the replacement

text of #1 there is the sequence

```
\install@mathalphabet<math alphabet identifier> #3{%  
  <Definitions for >#3}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

```
459   \def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%
```

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (`##1`), the following tokens in its third argument (`##3`), and the replacement text for the math alphabet identifier `#3` in its second argument. (`##2`). This is then recorded for later use in a temporary macro `\reserved@b`.

```
460       \def\reserved@b{##2}%
```

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (`##1` and `##3`) and the yet to build new definitions for the math alphabet identifier `#3`.

```
461       \def\reserved@c####1{\gdef#1{##1####1##3}}%
```

Then we execute our auxiliary macro.

```
462   \expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for `#3`. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group<math alphabet identifier>  
  <math group number><math extra part>  
<curr@fontshape definition>
```

So we define a new temporary macro `\reserved@a` that extracts these parts.

```
463   \def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

```
464       \reserved@c{%  
465         \getanddefine@fonts{#2}##2%  
466         \install@mathalphabet#3{%  
467           \relax\ifmmode \else \non@alpherr#3\fi  
468           \use@mathgroup##1{#2}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
469       \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi  
470         \use@mathgroup##1{#2}}%
```

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

```
471   \expandafter\reserved@a\reserved@b\@nil  
472 }
```

`\math@bgroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use `\bgroup` instead of `\begingroup` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```
473 \let\math@bgroup\bgroup  
474 \def\math@egroup#1{#1\egroup}
```

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in `mthscale.sty`.

```
475 \gdef\calculate@math@sizes{%
476   \@font@info{Calculating\space math\space sizes\space for\space
477     size\space <\f@size>}%
478   \dimen@\f@size \p@
479   \@tempdimb \defaultscritratio \dimen@
480   \dimen@ \defaultscritscritratio \dimen@
481   \expandafter\xdef\csname S@\f@size\endcsname{%
482     \gdef\noexpand\tf@size{\f@size}%
483     \gdef\noexpand\sfs@size{\strip@pt\@tempdimb}%
484     \gdef\noexpand\ssf@size{\strip@pt\dimen@}%
485     \noexpand\math@fontstrue}}
```

`\defaultscritratio` The default ratio for math sizes is:  
`\defaultscritscritratio` 1 to `\defaultscritratio` to `\defaultscritscritratio`.  
 By default this is 1 to .7 to .5.

```
486 \def\defaultscritratio{.7}
487 \def\defaultscritscritratio{.5}

504 \else
```

XeT<sub>E</sub>X version. When using system fonts XeT<sub>E</sub>X reports consecutive runs of characters as a single item in box logging, which means the standard `\showhyphens` does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the `lmr` OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that `\tracingonline` is locally zero.

```

# File p

## lfsstrc.dtx

### 28 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

**errorshow** Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

**warningshow** Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the `tracefont` package is *not* loaded!

**infoshow** Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the `tracefont` package is loaded.

**debugshow** In addition to `infoshow` show also changing of math fonts as far as possible (this option can produce a large amount of output).

**loading** Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the `tracefont` package became active.

**pausing** Turn all font warnings into errors so that L<sup>A</sup>T<sub>E</sub>X will stop.

### 29 A driver for this document

The next bit of code contains the documentation driver file for T<sub>E</sub>X, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L<sup>A</sup>T<sub>E</sub>X this will produce the documentation as well.

```
1 (*driver)
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{lfsstrc.dtx}
9 \end{document}
10 </driver>
```

## 30 The Implementation

**Warning:** Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11 (*package)
12 %\NeedsTeXFormat{LaTeX2e}
13 %\ProvidesPackage{tracefnt}[??/??/?? v?.??]
14 %
15 \input{Standard LaTeX package (font tracing)}
16 \end{package}
```

The debug module makes use of commands contained in a special package file named `trace.sty`.<sup>4</sup>

```
16 (+debug) \input trace.sty
```

## 31 Handling Options

`\tracingfonts` Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17 (*2kernel)
18 \def\tracingfonts{%
19   \@font@warning{Command \noexpand\tracingfonts
20     not provided.\MessageBreak
21     Use the ‘tracefnt’ package.\MessageBreak Command found:}%
22   \count@}
23 \end{2kernel}
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
24 (*package, trace, debug)
25 \newcount\tracingfonts
26 \tracingfonts=0
27 \end{package, trace, debug}
```

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefnt` is not loaded). `info` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
28 (*package)
29 \DeclareOption{errorshow}{%
30   \def\@font@info#1{%
31     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}}%
```

---

<sup>4</sup>This package is not in distribution at the moment (and probably doesn't any longer work). Think of this part of the code as being historical artefacts.

```

32             {LaTeX Font Info: \space\space\space#1}}%
33 \def\@font@warning#1{%
34     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
35             {LaTeX Font Warning: #1}}%
36 }
37 \DeclareOption{warningshow}{%
38     \def\@font@info#1{%
39         \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
40             {LaTeX Font Info: \space\space\space#1}}%
41     \def\@font@warning#1{%
42         \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
43             {LaTeX Font Warning: #1}}%
44 }
45 \DeclareOption{infoshow}{%
46     \def\@font@info#1{%
47         \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
48             {LaTeX Font Info: \space\space\space#1}}%
49     \def\@font@warning#1{%
50         \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
51             {LaTeX Font Warning: #1}}%
52 }
53 \DeclareOption{loading}{%
54     \tracingfonts\tw@
55 }
56 \DeclareOption{debugshow}{%
57     \ExecuteOptions{infoshow}%
58     \tracingfonts\thr@@
59 }
60 \DeclareOption{pausing}{%
61     \def\@font@warning#1{%
62         \GenericError
63             {(Font)\@spaces\@spaces\@spaces\space\space}%
64             {LaTeX Font Warning: #1}%
65             {See the LaTeX Companion for details.}%
66             {I'll stop for every LaTeX Font Warning because
67             you requested\MessageBreak the 'pausing' option
68             to the tracefmt package.}}%
69 }

```

We make `infoshow` the default, which in turn defines `\font@warning` and `\font@info`.

```

70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 \end{package}

```

We also need a default definition inside the kernel:

```

73 (*2kernel)
74 \def\@font@info#1{%
75     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
76             {LaTeX Font Info: \space\space\space#1}}%
77 \def\@font@warning#1{%
78     \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%

```

```
79 {LaTeX Font Warning: #1}}%
80 </2ekernel)
```

## 32 Macros common to fam.tex and tracefnt.sty

In the first versions of `tracefnt.dtx` some macros of `fam.dtx`<sup>5</sup> were redefined to include the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `lftfss.dtx`.

### 32.1 General font loading

`\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the `.tfm`) as it was determined by the NFSS tables.

```
81 (*2ekernel | package)
82 \def\extract@font{%
83   \get@external@font
```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```
84   \global\expandafter\font\font@name\external@font\relax
```

When tracing we typeout the internal and external font name.

```
85 (*trace)
86   \ifnum \tracingfonts >\@ne
87     \@font@info{External font '\external@font'
88               loaded as\MessageBreak \font@name}\fi
89 </trace)
```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```
90   \font@name \relax
```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```
91   \csname \f@encoding+\f@family\endcsname
92   \csname\curr@fontshape\endcsname
93   \relax
94   }
95 </2ekernel | package)
```

The `\relax` at the end needs to be explained. This is inserted to prevent `TEX` from scanning too far when it is executing the replacement text of the loading code macros.

`\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

```
96 (*2ekernel)
97 \def\get@external@font{%
```

---

<sup>5</sup>This file is currently not distributed in documented form. Its code is part of `lftfss.dtx`.

We don't know the external font name at the beginning.

```
98 \let\external@font\@empty
99 \edef\font@info{\expandafter\expandafter\expandafter\string
100 \csname \curr@fontshape \endcsname}%
101 \try@size@range
```

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It “knows about” `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```
102 \ifx\external@font\@empty
103 \try@size@substitution
104 \ifx\external@font\@empty
105 \latex@error{Font \expandafter \string\font@name\space
106 not found}\@eha
107 \error@fontshape
108 \get@external@font
109 \fi\fi
110 }
111 </2kernel>
```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```
112 (*2kernel | package)
113 \DeclareRobustCommand\selectfont
114 {%
```

When `debug` is specified we actually want something like ‘`undebug`’. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```
115 (+debug) \pushtracing
116 (+debug) \ifnum\tracingfonts<4 \tracingoff
117 (+debug) \else \tracingon\p@selectfont \fi
```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```
118 \ifx\f@linespread\baselinestretch \else
119 \set@fontsize\baselinestretch\f@size\f@baselineskip \fi
```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L<sup>A</sup>T<sub>E</sub>X's `\twfbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```
120 \xdef\font@name{%
121 \csname\curr@fontshape/\f@size\endcsname}%
```

We call the macro `\pickup@font` which will load the font if necessary.

```
122 \pickup@font
```

Then we select the font.

```
123 \font@name
```

If `\tracingfonts` is greater than 2 we also show the font switch. We do this before `\glb@settings` is called since this macro might redefine `\font@name`.

```
124 (*trace)
```

```

125     \ifnum \tracingfonts>\tw@
126         \font@info{Switching to \font@name}\fi
127 </trace>

```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```
128     \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```
129     \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

130 <+debug> \poptracing
131     }

```

`\set@fontsize` The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```

132 \def\set@fontsize#1#2#3{%
133     \@defaultunits\@tempdimb#2pt\relax\@nnil
134     \edef\f@size{\strip@pt\@tempdimb}%
135     \@defaultunits\@tempskipa#3pt\relax\@nnil
136     \edef\f@baselineskip{\the\@tempskipa}%
137     \edef\f@linespread{#1}%

```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```
138     \let\baselinestretch\f@linespread
```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```
139     \def\size@update{%
```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```

140         \baselineskip\f@baselineskip\relax
141         \baselineskip\f@linespread\baselineskip
142         \normalbaselineskip\baselineskip

```

then to set up a new `\strutbox`

```

143         \setbox\strutbox\hbox{%
144             \vrule\@height.7\baselineskip
145                 \@depth.3\baselineskip
146                 \@width\z@}%

```

We end with a bit of tracing information.

```

147 <*trace>
148     \ifnum \tracingfonts>\tw@
149         \ifx\f@linespread\@empty
150             \let\reserved@a\@empty
151         \else
152             \def\reserved@a{\f@linespread x}%
153         \fi
154         \font@info{Changing size to \f@size/\reserved@a
155                 \f@baselineskip}%
156         \aftergroup\type@restoreinfo \fi
157 </trace>

```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```
158     \let\size@update\relax}%
159 }
```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let!`

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
160 \let\size@update\relax
```

`\type@restoreinfo` This macro produces some info when a font size and/or baseline change will get restored.

```
161 (*trace)
162   \def\type@restoreinfo{%
163     \ifx\f@linespread\@empty
164       \let\reserved@a\@empty
165     \else
166       \def\reserved@a{\f@linespread x}%
167     \fi
168     \@font@info{Restoring size to
169               \f@size/\reserved@a\f@baselineskip}}
170 </trace>
```

`\glb@settings` The macro `\glb@settings` globally selects all math fonts for the current size if necessary.

```
171 \def\glb@settings{%
```

When `\glb@settings` gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to `\math@fonts`. But this happens only if the `math@fonts` switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the `S@...` macro is not defined we have to first calculate the three sizes.

```
172   \expandafter\ifx\csname S@\f@size\endcsname\relax
173     \calculate@math@sizes
174   \fi
```

The effect of this is that `\calculate@math@sizes` may or may not define the `S@...` macro. In the first case the next time the same size is requested this macro is used, otherwise `\calculate@math@sizes` is called again. This also sets the `math@fonts` switch. If it is true we must switch the math fonts.

```
175   \csname S@\f@size\endcsname
176   \ifmath@fonts
177 (*trace)
178   \ifnum \tracingfonts>\tw@
179     \@font@info{Setting up math fonts for
180               \f@size/\f@baselineskip}\fi
181 </trace>
```

Inside a group we execute the macro for the current math *version*. This sets `\math@fonts` to a list of `\textfont...` assignments. `\getanddefine@fonts` (which may be called at this point) needs the `\escapechar` parameter to be set to `-1`.

```
182     \begingroup
183     \escapechar\m@ne
184     \csname mv@\math@version \endcsname
```

Then we set `\globaldefs` to 1 so that all following changes are done globally. The math font assignments recorded in `\math@fonts` are executed and `\glb@currrsize` is set equal to `\f@size`. This signals that the fonts for math in this size are set up.

```
185     \globaldefs\@ne
186     \math@fonts
187     \let \glb@currrsize \f@size
188     \endgroup
```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within `\globaldefs\@ne` as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```
189     \the\every@math@size
```

Otherwise we announce that the math fonts are not set up for this size.

```
190 (*trace)
191     \else
192     \ifnum \tracingfonts>\tw@
193     \font@info{No math setup for
194             \f@size/\f@baselineskip}\fi
195 </trace>
196     \fi
197 }
198 </2ekernel | package>
```

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```
199 (*2ekernel)
200 \def\baselinestretch{1}
```

`\every@math@size` We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```
201 \newtoks\every@math@size
202 \every@math@size={ }
203 </2ekernel>
```

## 32.2 Math fonts setup

### 32.2.1 Outline of algorithm for math font sizes

$\TeX$  uses the the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in

an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

```
$ a=b+c \mbox{\small for all $b$ and $c\in Z$}$
```

Here the inner formulae `b` and `c\in Z` are typeset in `\small` but we have to return to `\normalsize` before we reach the closing `$` of the outer formula.

This is handled in the following way:

1. At any point in the document the global variable `\gbl@currsize` contains the point size for which the math fonts currently are set up.
2. Whenever we start a formula we compare its value with the local variable `\f@size` that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call `\gbl@settings` which changes the math font setup and updates `\gbl@currsize`.
  - (a) If we are recursively inside another formula (`\if@inmath`) we ensure that `\gbl@settings` is executed again in the outer formula, so that the old setup is automatically restored.
  - (b) Otherwise, we set the switch `@inmath` locally to `true` so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
  - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
  - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of `\aftergroup` commands and checks. Compared to the original algorithm this involves additional checks ( $2 \times$  (non-math levels) per inner formula).

### 32.2.2 Code for math font size setting

`\check@mathfonts` In the `\check@mathfonts` macros we implement the steps 2 to 4 except that instead of a switch the macro `\init@restore@glb@settings` is used.

```

204 (*2kernel | package)
205 \def\check@mathfonts{%
206   \ifx \glb@currsiz \f@size

250         \fi
251     \endgroup
252 }

```

### 32.2.3 Other code for math

`\use@mathgroup` The `\use@mathgroup` macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```

253 \def\use@mathgroup#1#2{\relax\ifmmode

254 (*trace)
255   \ifnum \tracingfonts>\tw@
256     \count@#2\relax
257     \@font@info{Using \noexpand\mathgroup
258               (\the\count@) #2}\fi
259 </trace>

```

If so we first call the '=' macro (i.e. argument three) to set up special things for the selected math group. Then we call `\mathgroup` to select the group given by argument two and finally we place #1 (i.e. the argument of the *math alphabet identifier*) at the end. This part of the code is surrounded by two commands which behave like `\begingroup` and `\endgroup` if we want *math alphabet identifier*s but will expand into `\@empty` if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a `\relax`. Otherwise something like `\mit{1}` would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

260     \math@bgroup
261     \expandafter\ifx\csname M@f@encoding\endcsname#1\else
262     #1\fi
263     \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the *math alphabet identifier* isn't called in math mode, we remove the `\fi` with the `\expandafter` trick. This is necessary if the token is actually a macro with arguments. In such a case the `\fi` will be misinterpreted as the first argument which would be disastrous.

```

264     \expandafter\math@egroup\fi}%

```

The surrounding macros equal `\begingroup` and `\endgroup`. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in  $\mathcal$ -TeX macros for placing accents.

`\math@egroup` If the `margid` option is in force (which can be tested by looking at the definition of `\math@bgroup` we change the `\math@egroup` command a bit to display the current *math group number* after it closes the scope of *math alphabet* with `\endgroup`.

```

265 (*trace)
266   \ifx\math@bgroup\bgroup
267     \def\math@egroup#1{#1\egroup

```

```

268     \ifnum \tracingfonts>\tw@
269     \@font@info{Restoring \noexpand\mathgroup
270       (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
271       }\fi}
272   \fi
273 </trace>

```

`\getanddefine@fonts` `\getanddefine@fonts` has two arguments: the *(math group number)* and the *family/series/shape* name as a control sequence.

```

274 \def\getanddefine@fonts#1#2{%
First we turn of tracing when \tracingfonts is less than 4.
275 <+debug> \pushtracing
276 <+debug> \ifnum\tracingfonts<4 \tracingoff
277 <+debug> \else \tracingon\getanddefine@fonts \fi

278 <*trace>
279 \ifnum \tracingfonts>\tw@
280 \count@#1\relax
281 \@font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
282 \string#2 \tf@size/\sf@size/\ssf@size}\fi
283 </trace>

```

We append the current `\tf@size` to `#2` to obtain the font name.<sup>6</sup> Again, `font@name` is defined globally, for the reasons explained in the description of `\wrong@fontshape`.

```

284 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%

```

Then we call `\pickup@font` to load it if necessary. We remember the internal name as `\textfont@name`.

```

285 \pickup@font \let\textfont@name\font@name

```

Same game for `\scriptfont` and `\scriptscriptfont`:

```

286 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
287 \pickup@font \let\scriptfont@name\font@name
288 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
289 \pickup@font

```

Then we append the new `\textfont...` assignments to the `\math@fonts`.

```

290 \edef\math@fonts{\math@fonts
291 \textfont#1\textfont@name
292 \scriptfont#1\scriptfont@name
293 \scriptscriptfont#1\font@name}%

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

294 <+debug> \poptracing
295   }
296 </2ekernel | package>

```

---

<sup>6</sup>One might ask why this expansion does not generate a macro name that starts with an additional `\` character. The solution is that `\escapechar` is set to `-1` before `\getanddefine@fonts` is called.

### 33 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\@gobble` which discards the following argument, otherwise it expands to `\@firstofone` which reproduces its argument.

```
297 (*2ekernel)
298 \def\ifnot@nil#1{\def\reserved@a{#1}%
299 \ifx\reserved@a\@nil \expandafter\@gobble
300 \else \expandafter\@firstofone\fi}
```

`\remove@to@nnil` Three other auxiliary macros will be needed in the following: `\remove@to@nnil` gobbles up everything up to, and including, the next `\@nnil` token, and `\remove@angles` and `\remove@star` do the same for the character `>` and `*`, respectively, instead of `\@nnil`.

```
301 \def\remove@to@nnil#1\@nnil{}
302 \def\remove@angles#1>{\set@simple@size@args}
303 \def\remove@star#1*{#1}
```

`\extract@sizefn` This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
304 \def\extract@sizefn#1##2\@nil{%
305 \if>#2>\set@size@func@args#1\@nil
306 \let\sizefn@info\@empty
307 \else\expandafter\set@size@func@args\remove@star#2\@nil
308 \def\sizefn@info{#1}\fi
309 }
```

`\try@simple@size` This function tries to extract the given size (specified by `\f@size`) for the requested font shape. The font information must already be present in `\font@info`. The central macro that does the real work is `\extract@fontinfo`. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The corresponding font definitions have already been extracted from the macro `\OT1/cm/sansserif/normal` and stored in `font@info`. (Otherwise `\extract@fontinfo` doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro `\extract@fontinfo` to find the external font name (‘cmss12’) for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
\set@simple@size@args#3<#4\@nnil
\execute@size@function{#2}}
```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nnil
```

#1 will contain all characters before <12\*>, #2 will be empty, #3 will be exactly cmss12, and #4 will be 17>cmss17. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument argument set to empty and its mandatory argument set to cmss12 by \set@simple@size@args. As we discussed earlier, the effect of the default size function is to load the given external font (cmss12) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list \font@info. And the simple definition of \extract@fontinfo we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define \extract@fontinfo as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
  \ifnot@nil{#3}%
    {\set@simple@size@args#3<#4\@nnil
      \execute@size@function{#2}%
    }%
}
```

How does this work? We call \extract@fontinfo via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil
```

i.e. by appending <12\*>\@nil<\@nnil. If the size ('12' in this case) appears in \font@info everything works as explained above, the only difference being that argument #4 of \extract@fontinfo additionally gets the tokens <12\*>\@nil<\@nnil. However, if the size is not found everything up to the final <12\*> is in argument #1, #3 gets \@nil, and #2 and #4 are empty. The macro \ifnot@nil will discard the calls to \set@simple@size@args and execute@size@function, and hence \font@info will continue to be equal to \@empty. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in \set@simple@size@args below.

The macros are hidden inside other control sequences so that we have to build \extract@fontinfo in several steps.

So here's the actual definition of \extract@font in \try@simple@size.

```
310 % % this could be replaced by \try@size@range making the subst slower!
```

```
311 \def\try@simple@size{%
```

```
\reserved@a is made an abbreviation for the head of the definition of the macro
\extract@fontinfo.
```

```
312   \def\reserved@a{\def\extract@fontinfo###1}%
```

Now we can define \extract@fontinfo. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the \* character.

```
313   \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nnil{%
```

```
314     \ifnot@nil{##2}%
```

```

315         {\set@simple@size@args##2<##3\@nnil
316         \execute@size@function\sizefn@info
317         }}%

```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```

318     \expandafter\expandafter
319     \expandafter\extract@fontinfo\expandafter\font@info
320     \expandafter<\f@size>\@nil<\@nnil
321 }

```

`\set@simple@size@args` As promised above, the macro `\set@simple@size@args` will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character `<`. By starting the definition as follows,

```

322 \def\set@simple@size@args#1<{%

```

parameter `#1` is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character `<` cannot appear in `#1`) by calling `\remove@angles` for empty `#1` and `\extract@sizefn` otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by `\remove@to@nnil`. Note also the use of Kabelschacht's method.

```

323     \if<#1<%
324     \expandafter\remove@angles
325     \else
326     \extract@sizefn#1*\@nil
327     \expandafter\remove@to@nnil
328     \fi}

```

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macros for extraction of size range specification.

`\extract@rangefontinfo` `\extract@rangefontinfo` goes through a font shape definition in the input until it recognizes the tokens `<\@nil->`. It looks for font ranges with font size functions. It's operation is rather simple: it discards everything up to the next size specification and passes this on to `\is@range` for inspection. The specification (parameter `#2` is inserted again, in case it is needed later.

```

329 \def\extract@rangefontinfo#1<#2>{%
330     \is@range#2->\@nil#2>}

```

`\is@range` `\is@range` is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls `\extract@rangefontinfo` to continue the search. Otherwise it calls `\check@range` to check the requested size against the specified range.

From the way `\is@range` is called inside `\extract@rangefontinfo` we see that `#2` is the character `>` if the size specification found is a simple one (as it does not contain a `-` character. This is checked easily enough and `\extract@rangefontinfo` called again. Note that the extra tokens inserted after the `\@nil` in the call to `\is@range` appear at the beginning of the first argument to `\extract@rangefontinfo` and are hence ignored.

`\s@fct@subf` The `subf` size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```

493 \DeclareSizeFunction{subf}{\subf@sfcnt\@font@warning}
494 \DeclareSizeFunction{ssubf}{\subf@sfcnt\@font@info}
495 \def\subf@sfcnt#1{%
496     #1{Font\space shape\space '\curr@fontshape'\space in\space
497         size\space \f@size\space not\space available\MessageBreak
498         external\space font\space '\mandatory@arg'\space used}%
499     \empty@sfcnt#1%
500 }

```

`\s@fct@fixed` The `fixed` size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```

501 \DeclareSizeFunction{fixed}{\fixed@sfcnt\@font@warning}
502 \DeclareSizeFunction{sfixed}{\fixed@sfcnt\@font@info}
503 \def\fixed@sfcnt#1{%
504     \ifx\optional@arg\@empty
505         \let\external@font\mandatory@arg
506     \else
507         \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
508     \fi
509     #1{External\space font\space '\external@font'\space loaded\space
510         for\space size\MessageBreak
511         <\f@size>}%
512 }
513 /2kernel

```

```

```

`\@xxDeclareMathDelimiter`

This macro checks if the second arg is a “math type” such as `\mathopen`. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```

685 \def\@xxDeclareMathDelimiter#1#2#3#4{%

```

7 is the default value returned in the case that `\mathchar@type` is passed something unexpected, like a math symbol font name. We locally move `\mathalpha` out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```

686 \begingroup
687 \let\mathalpha\mathord
688 \ifnum7=\mathchar@type{#2}%
689 \endgroup

```

If this branch is taken we have old syntax (5 arguments).

```

690 \expandafter\@firstofone
691 \else

```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```
692     \endgroup
693     \DeclareMathSymbol#1{#2}{#3}{#4}%
```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

869   \expandafter\DeclareSymbolFontAlphabet@
870   \csname \expandafter@gobble\string#1\space\endcsname{#2}#1}
871 \@onlypreamble\DeclareSymbolFontAlphabet

```

\DeclareSymbolFontAlphabet@

```

872 \def\DeclareSymbolFontAlphabet@#1#2#3{%

```

We use the switch `\if@tempswa` to decide if we can declare this symbol font alphabet.

```
873 \if@tempswa true
```

First check if #2 is known to be a symbol font

```
874 \expandafter\in@\csname sym#2\expandafter\endcsname
875 \expandafter{\group@list}%
876 \ifin@
```

Check if #1 is defined as a math alphabet defined via `\DeclareMathAlphabet`:

```
877 \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
878 \ifin@
```

If so remove it from the `\alpha@list` and from all math version macros.

```
879 \@font@info{Redefining math alphabet \string#3}%
880 \toks@{}%
881 \def\alpha@elt##1##2##3{%
882 \ifx##1#1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
883 \alpha@list
884 \xdef\alpha@list{\the\toks@}%
```

Now we loop over all versions and remove the math alphabet:

```
885 \def\version@elt##1{%
886 \begingroup
887 \toks@{}%
888 \def\getanddefine@fonts####1####2{%
889 \addto@hook\toks@{\getanddefine@fonts####1####2}}%
890 \def\install@mathalphabet####1####2{%
891 \ifx####1#1\else
892 \addto@hook\toks@{\install@mathalphabet
893 ####1{####2}}\fi}%
894 ##1%
895 \xdef##1{\the\toks@}%
896 \endgroup
897 }%
898 \version@list
899 \else
```

If #3 is not defined as a math alphabet check if it is defined at all:

```
900 \expandafter\ifx
901 \csname\expandafter\@gobble\string#1\space\endcsname
902 \relax
```

If it is undefined, fine otherwise check if it is a math alphabet defined via `\DeclareSymbolFontAlphabet`:

```
903 \else
904 \edef\reserved@a{%
905 \noexpand\in@{\string\use@mathgroup}{\meaning#1}}%
906 \reserved@a
907 \ifin@
908 \@font@info{Redefining math alphabet \string#3}%
909 \else
```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```
910 \if@tempswa false
```

```

911         \@latex@error{Command ‘\string#3’ already defined}\@eha
912         \fi
913     \fi
914 \fi
915 \else

```

Since the symbol font is not known we better skip defining this alphabet.

```

916     \@tempswafalse
917     \@latex@error{Unknown symbol font ‘#2’}\@eha
918     \fi
919     \if@tempswa

```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup <math-settings> \sym<name>
```

The *<math-settings>* are the one for the encoding that is used in the font shape where *\sym<name>* is pointing to. This means that we have to get it from the information stored in *\group@list*. Thus we loop through that list after defining *\group@elt* in a suitable way.

```

920     \def\group@elt##1##2{%
921         \expandafter\ifx\csname sym#2\endcsname##1%
922         \expandafter\reserved@a\string##2\@nil
923         \fi}%
924     \def\reserved@a##1##2/##3\@nil{%
925         \def\reserved@a{##2}}%
926     \group@list
927     \toks@{\relax\ifmode \else \non@alpherr#1\fi}%
928     \edef#1{\the\toks@
929         \noexpand\use@mathgroup
930         \expandafter\noexpand\csname M@\reserved@a\endcsname
931         \csname sym#2\endcsname}%
932     \def#3{\protect#1}%
933     \fi
934 }
935 \@onlypreamble\DeclareSymbolFontAlphabet@
936 </2kernel>

```

## File s

# ltfssini.dtx

This file contains the top level L<sup>A</sup>T<sub>E</sub>X interface to the font selection scheme commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of these commands.

## 35 NFSS Initialisation

Finally, there are six commands that are to be used in L<sup>A</sup>T<sub>E</sub>X and that we will therefore protect against expansion at the wrong point: `\fontfamily`, `\fontseries`, `\fontshape`, `\fontsize`, `\selectfont`, and `\mathversion`.

```
1 <*2ekernel>
```

### 35.1 Providing math *versions*

L<sup>A</sup>T<sub>E</sub>X provides two *versions*. We call them *normal* and *bold*, respectively.

```
2 \DeclareMathVersion{normal}
3 \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of `\rmfamily` etc. in math mode.

First the changes to another *family*:

```
4 \DeclareRobustCommand\rmfamily
5     {\not@math@alphabet\rmfamily\mathrm
6     \fontfamily\rmdefault\selectfont}
7 \DeclareRobustCommand\sffamily
8     {\not@math@alphabet\sffamily\mathsf
9     \fontfamily\sfdefault\selectfont}
10 \DeclareRobustCommand\ttfamily
11     {\not@math@alphabet\ttfamily\mathtt
12     \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
13 \DeclareRobustCommand\bfseries
14     {\not@math@alphabet\bfseries\mathbf
15     \fontseries\bfdefault\selectfont}
16 \DeclareRobustCommand\mdseries
17     {\not@math@alphabet\mdseries\relax
18     \fontseries\mddefault\selectfont}
19 \DeclareRobustCommand\upshape
20     {\not@math@alphabet\upshape\relax
21     \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
22 \DeclareRobustCommand\slshape
23     {\not@math@alphabet\slshape\relax
24     \fontshape\sldefault\selectfont}
25 \DeclareRobustCommand\scshape
26     {\not@math@alphabet\scshape\relax
27     \fontshape\scdefault\selectfont}
```

```

28 \DeclareRobustCommand\itshape
29     {\not@math@alphabet\itshape\mathit
30     \fontshape\itdefault\selectfont}

```

`\em` We also have to define the *emphasize* font change command (i.e. `\em`). This command will look is the current font is sloped (i.e. has a positive `\fontdimen1`) and will then select either `\upshape` or `\itshape`.

```

31 </2ekernel>
32 (latexrelease)\IncludeInRelease{2015/01/01}{\eminershape}{\eminershape}%
33 (*2ekernel | latexrelease)
34 \DeclareRobustCommand\em
35     {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
36     \eminershape \else \itshape \fi}%

37 \def\eminershape{\upshape}%
38 </2ekernel | latexrelease>
39 (latexrelease)\EndIncludeInRelease
40 (latexrelease)\IncludeInRelease{0000/00/00}{\eminershape}{\eminershape}%
41 (latexrelease)\DeclareRobustCommand\em
42 (latexrelease)     {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
43 (latexrelease)     \upshape \else \itshape \fi}%
44 (latexrelease)\let\eminershape\@undefined
45 (latexrelease)\EndIncludeInRelease
46 (*2ekernel)

```

`\not@math@alphabet` This function generates an error message when it is called in math mode. The same function should be defined in `newlfont.sty`.

```

47 \def\not@math@alphabet#1#2{%
48     \relax
49     \ifmmode
50         \@latex@error{Command \noexpand#1invalid in math mode}%
51         {%
52             Please
53             \ifx#2\relax
54                 define a new math alphabet^^J%
55                 if you want to use a special font in math mode%
56             \else

```

We have to a `\noexpand` below to prevent expansion of `#2`. In case of `#1` we can omit this (due to the current definition of robust commands since they do come out right there :-).

```

57         use the math alphabet \noexpand#2instead of
58         the #1command%
59         \fi
60         .
61     }%
62     \fi}

```

Finally we provide two abbreviations to switch to the  $\text{\LaTeX}$  *versions*.

```

63 \def\boldmath{\@nomath\boldmath
64     \mathversion{bold}}
65 \def\unboldmath{\@nomath\unboldmath
66     \mathversion{normal}}

```

Here we switch to the default math version by defining the internal macro `\math@version`. We dare not to call `\mathversion` at this place because this would call `\glb@settings`.

```
67 \def\math@version{normal}
```

## 35.2 Miscellaneous

`\newfont` We start by defining a few macros that are part of standard L<sup>A</sup>T<sub>E</sub>X's user interface.  
`\symbol` The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

```
68 \def\newfont#1#2{\ifdefinable#1{\font#1=#2\relax}}
69 \def\symbols#1{\char #1\relax}
```

`\@setfontsize` This abbreviation is used by L<sup>A</sup>T<sub>E</sub>X's user level size changing commands, such as  
`\@setsize` `\large`.

```
70 \def\@setfontsize#1#2#3{\nomath#1%
```

For the benefit of people relying on keeping the name of the current font command saved in `\@currsize` we define it. To ensure that `\@setfontsize` keeps being robust we omit this assignment during times where `\protect` differs from `\@typeset@protect`.

```
71 \ifx\protect\@typeset@protect
72 \let\@currsize#1%
73 \fi
74 \fontsize{#2}{#3}\selectfont}
```

For compatibility we also define `\@setsize` the 209 command

```
75 \*compat)
76 \def\@setsize#1#2#3#4{\@setfontsize#1{#4}{#2}}
77 \</compat)
```

`\oldstylenums` This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
78 \def\oldstylenums#1{%
79 \begingroup
```

Provide spacing using the interword space of the current font.

```
80 \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding `.fd` file (which is the case for standard L<sup>A</sup>T<sub>E</sub>X fonts even though they only contain substitutions).

```
81 \usefont{OML}{\rmdefault}{\f@series}{it}%
82 \mathgroup\symbols #1%
83 \endgroup
84 }
```

`\hexnumber@` To set up L<sup>A</sup>T<sub>E</sub>X's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple `\ifcase`.

```
85 \def\hexnumber@#1{\ifcase\number#1
```

```
86 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
87 9\or A\or B\or C\or D\or E\or F\fi}
```

`\nfss@text` In its simplest form `\nfss@text` is an `\mbox`. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the `amstex` style option one will get a sub style called `amstext` which will redefine the `\nfss@text` macro to produce correct text in all sizes.

We have to use `\def` instead of the shorter `\let` since `\mbox` is undefined when we reach this point.

```
88 \def\nfss@text#1{\mbox{#1}}
```

`\copyright` The definition of `\copyright` was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in `ltoutenc.dtx`.

```
89 %\DeclareRobustCommand\copyright
90 %   {\ooalign{\hfil
91 %     \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
92 %     \mathhexbox20D}}}
```

`\normalfont` The macro `\reset@font` is used in L<sup>A</sup>T<sub>E</sub>X to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L<sup>A</sup>T<sub>E</sub>X version above but nevertheless are able to run all kind of mixtures.

The user interface name for `\reset@font` is `\normalfont`:

```
93 \DeclareRobustCommand\normalfont
94     {\usefont\encodingdefault
95         \familydefault
96         \seriesdefault
97         \shapedefault
98         \relax}
99 \let\reset@font\normalfont
```

We left out the special L<sup>A</sup>T<sub>E</sub>X fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```
100 \def\not@base#1{\@latex@error
101   {Command \noexpand#1not provided in base LaTeX2e}%
102   {Load the latexsym or the amsfonts package to
103   define this symbol}}
104 \def\mho{\not@base\mho}
105 \def\Join{\not@base\Join}
106 \def\Box{\not@base\Box}
107 \def\Diamond{\not@base\Diamond}
108 \def\leadsto{\not@base\leadsto}
109 \def\squsubset{\not@base\squsubset}
110 \def\sqsupset{\not@base\sqsupset}
111 \def\lhd{\not@base\lhd}
```

```

112 \def\unlhd{\not@base\unlhd}
113 \def\rhd{\not@base\rhd}
114 \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```

115 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}  %% don't modify this setting
116   %% overwrite it in fontdef.cfg
117   %% if necessary

```

We now load the customizable parts of NFSS.

```

118 \InputIfFileExists{fonttext.cfg}
119     {\typeout{=====^^J%
120             ^^J%
121             Local config file fonttext.cfg used^^J%
122             ^^J%
123             =====}%
124     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
125     }
126     {\input{fonttext.ltx}}
127 \let\@addtofilelist\gobble

```

Ditto for math although I don't think that we will get a lot of customisation :-)

```

128 \InputIfFileExists{fontmath.cfg}
129     {\typeout{=====^^J%
130             ^^J%
131             Local config file fontmath.cfg used^^J%
132             ^^J%
133             =====}%
134     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
135     }
136     {\input{fontmath.ltx}}
137 \let\@addtofilelist\gobble

```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file `preload.ltx`.

```

138 \InputIfFileExists{preload.cfg}
139     {\typeout{=====^^J%
140             ^^J%
141             Local config file preload.cfg used^^J%
142             ^^J%
143             =====}%
144     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
145     }
146     {\input{preload.ltx}}
147 \let\@addtofilelist\gobble

```

```

\@acci We also save the values of some accents in \@acci, \@accii and \@acciii so they
\@accii can be restored by a minipage inside a tabbing environment.
\@acciii 148 \let\@acci\ ' \let\@accii\ ' \let\@acciii\ =

```

\cal Here were the two old (*alphabet identifiers*).  
\mit 149 (/2ekernel)

# File t

## fontdef.dtx

j-latexreleasej [2018/09/24 v3.0b LaTeX Kernel (j-latexreleasej font setup)]

### 36 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

### 37 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If  $\text{\LaTeX} 2_{\epsilon}$  finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

**Warning:** please note that we don't support customised  $\text{\LaTeX}$  versions. Thus, before sending in a bug report please try your test file with a  $\text{\LaTeX}$  format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all  $\text{\LaTeX}$  installations behave in the same way.

|     |                                                      |
|-----|------------------------------------------------------|
| T1  | Cork T <sub>E</sub> X text encoding                  |
| OT1 | old T <sub>E</sub> X text encoding                   |
| U   | unknown encoding                                     |
| OML | old T <sub>E</sub> X math letters encoding           |
| OMS | old T <sub>E</sub> X math symbols encoding           |
| OMX | old T <sub>E</sub> X math extension symbols encoding |
| TU  | Unicode                                              |

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the T<sub>E</sub>X user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official T<sub>E</sub>X text encoding.

**Warning:** If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all L<sup>A</sup>T<sub>E</sub>X installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

## 38 The docstrip modules

The following modules are used to direct `docstrip` in generating external files:

|         |                                                |
|---------|------------------------------------------------|
| driver  | produce a documentation driver file            |
| text    | produce the file <code>fonttext.ltx</code>     |
| math    | produce the file <code>fontmath.ltx</code>     |
| cfgtext | produce a dummy <code>fonttext.cfg</code> file |
| cfgmath | produce a dummy <code>fontmath.cfg</code> file |

A typical `docstrip` command file would then have entries like:

```
\generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}
```

## 39 A driver for this document

The next bit of code contains the documentation driver file for T<sub>E</sub>X, i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
```

```

4 \begin{document}
5   \DocInput{fontdef.dtx}
6 \end{document}
7 </driver>

```

## 40 The fonttext.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```

8 (*text)
9 \typeout{=== Don't modify this file, use a .cfg file instead ===^^J}

```

### 40.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `ltoutenc.dtx`.

By convention, text encoding specific declarations, including the declaration `\DeclareFontEncoding`, are kept in separate file of the form  $\langle enc \rangle enc.def$ , e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```

10 \input {omlenc.def}
11 \input {t1enc.def}
12 \input {ot1enc.def}      % <- should come after T1 for speed
13 \input {omsenc.def}

```

```

14 \ifx\Umathchar\@undefined

```

We then set set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```

15 \fontencoding{OT1}

```

```

16 \else

```

Unicode.

```

17 \input {tuenc.def}
18 \fontencoding{TU}
19 \DeclareFontSubstitution{TU}{lmr}{m}{n}
20 \begingroup
21 \nfss@catcodes
22 \input {tulmr.fd}
23 \input {tulmss.fd}
24 \input {tulmtt.fd}
25 \endgroup
26 \DeclareFontSubstitution{TU}{lmr}{m}{n}

```

End of Unicode branch.

```
27 \fi
```

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

```
28 \DeclareFontEncodingDefaults{}{}
```

Then we define the default substitution for every encoding. This release of  $\text{\LaTeX} 2_{\epsilon}$  assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

```
29 \DeclareFontSubstitution{T1}{cmr}{m}{n}
```

```
30 \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

For every encoding declaration,  $\text{\LaTeX} 2_{\epsilon}$  will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered.  $\text{\LaTeX} 2_{\epsilon}$  will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the corresponding `.fd` files now. If we don't do this they would be loaded at verification time (i.e. at `\begin{document}`) which would delay processing unnecessarily.

**Warning:** Please note that this means that you have to regenerate the format whenever you change any of these `.fd` files since  $\text{\LaTeX} 2_{\epsilon}$  will not read `.fd` files if it already knows about the encoding/family combination.

The `\nfss@catcodes` ensures that white space is ignored in any definitions made in the `fd` files.

```
31 \begingroup
```

```
32 \nfss@catcodes
```

```
33 \input {t1cmr.fd}
```

```
34 \input {ot1cmr.fd}
```

```
35 \endgroup
```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading `.fd` files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every  $\text{\TeX}$  installation, while the amount of main memory is not a limiting factor at most installations.)

```
36 \begingroup
```

```
37 \nfss@catcodes
```

```
38 \input {ot1cmss.fd}
```

```
39 \input {ot1cmtt.fd}
```

```
40 \endgroup
```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a .fd file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```
41 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}
```

This means, “if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding”. You can change the font used but the encoding should be the same as the one specified with `\fontencoding` above.

## 40.2 Defaults

To allow the use of `\rmfamily`, `\sffamily`, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for `\encodingdefault`) without making documents non-portable.

```
\encodingdefault The following three definitions set up the meaning for \rmfamily, \sffamily, and
\rmdefault      \ttfamily.
\sfdefault      42 \ifx\Umathchar\@undefined
\ttdefault      43 \newcommand\encodingdefault{OT1}
                44 \newcommand\rmdefault{cmr}
                45 \newcommand\sfdefault{cmss}
                46 \newcommand\ttdefault{cmtt}
                47 \else
                48 \newcommand\encodingdefault{TU}
                49 \newcommand\rmdefault{lmr}
                50 \fontfamily{\rmdefault}
                51 \newcommand\sfdefault{lmss}
                52 \newcommand\ttdefault{lmtt}
                53 \fi
                54 </text>
                55 <latexrelease>\IncludeInRelease{2017/01/01}%
                56 <latexrelease>      {\encodingdefault}{TU encoding default}%
                57 <latexrelease>\ifx\Umathchar\@undefined
                58 <latexrelease>\renewcommand\encodingdefault{OT1}
                59 <latexrelease>\fontencoding{\encodingdefault}
                60 <latexrelease>\renewcommand\rmdefault{cmr}
                61 <latexrelease>\fontfamily{\rmdefault}
                62 <latexrelease>\renewcommand\sfdefault{cmss}
                63 <latexrelease>\renewcommand\ttdefault{cmtt}
                64 <latexrelease>\else
                65 <latexrelease>\renewcommand\encodingdefault{TU}
                66 <latexrelease>%done in everyjob\fontencoding{\encodingdefault}
                67 <latexrelease>\renewcommand\rmdefault{lmr}
                68 <latexrelease>\fontfamily{\rmdefault}
                69 <latexrelease>\renewcommand\sfdefault{lmss}
                70 <latexrelease>\renewcommand\ttdefault{lmtt}
                71 <latexrelease>\fi
                72 <latexrelease>\EndIncludeInRelease
                73 <latexrelease>\IncludeInRelease{0000/00/00}%
```

```

74 (latexrelease)           {\encodingdefault}{TU encoding default}%
75 (latexrelease)\fontencoding{OT1}
76 (latexrelease)\renewcommand\encodingdefault{OT1}
77 (latexrelease)\fontencoding{\encodingdefault}
78 (latexrelease)\renewcommand\rmdefault{cmr}
79 (latexrelease)\fontfamily{\rmdefault}
80 (latexrelease)\renewcommand\sfddefault{cmss}
81 (latexrelease)\renewcommand\ttdefault{cmtt}
82 (latexrelease)\EndIncludeInRelease
83 (*text)

\bfdefault Series changing commands are influenced by the following hooks.
\mddefault 84 \newcommand\bfdefault{bx}
            85 \newcommand\mddefault{m}

\itdefault Shape changing commands use the following hooks.
\sldefault 86 \newcommand\itdefault{it}
\scdefault 87 \newcommand\sldefault{sl}
\updefault 88 \newcommand\scdefault{sc}
            89 \newcommand\updefault{n}

\familydefault Finally we have the hooks that describe the behaviour of the \normalfont com-
\seriesdefault mand. To stay portable, the definition of \encodingdefault should not be
\shapedefault changed and should match the setting above for \fontencoding. All other values
            can be set according to your taste.
            90 \newcommand\familydefault{\rmdefault}
            91 \newcommand\seriesdefault{\mddefault}
            92 \newcommand\shapedefault{\updefault}

            This finishes the low-level setup in fonttext.ltx.
            93 </text>

```

## 41 The fontmath.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```

94 (*math)
95 \typeout{=== Don't modify this file, use a .cfg file instead ===^^J}

```

### 41.1 The font encodings used

```

96 \DeclareFontEncoding{OML}{}{}
97 \DeclareFontEncoding{OMS}{}{}
98 \DeclareFontEncoding{OMX}{}{}

```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up `\noaccents@` providing for AMS- $\LaTeX$ . This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from `\breve`) are obtained from some other font that has them.

```

99 \DeclareFontEncoding{U}{}{\noaccents@}

```

The encodings for math are next:

```

100 \DeclareFontSubstitution{OML}{cmm}{m}{it}

```

```

101 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
102 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
103 \DeclareFontSubstitution{U}{cmr}{m}{n}
104 \begingroup
105 \nfss@catcodes
106 \input {omlcmm.fd}
107 \input {omscmsy.fd}
108 \input {omxcmex.fd}
109 \input {ucmr.fd}
110 \endgroup

```

#### 41.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by L<sup>A</sup>T<sub>E</sub>X. These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. `operators` with `OT1` etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```

111 \DeclareSymbolFont{operators} {OT1}{cmr} {m}{n}
112 \DeclareSymbolFont{letters} {OML}{cmm} {m}{it}
113 \DeclareSymbolFont{symbols} {OMS}{cmsy}{m}{n}
114 \DeclareSymbolFont{largesymbols}{OMX}{cmex}{m}{n}

115 \SetSymbolFont{operators}{bold}{OT1}{cmr} {bx}{n}
116 \SetSymbolFont{letters} {bold}{OML}{cmm} {b}{it}
117 \SetSymbolFont{symbols} {bold}{OMS}{cmsy}{b}{n}

```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```

118 \DeclareSymbolFontAlphabet{\mathrm} {operators}
119 \DeclareSymbolFontAlphabet{\mathnormal}{letters}
120 \DeclareSymbolFontAlphabet{\mathcal} {symbols}
121 \DeclareMathAlphabet {\mathbf} {OT1}{cmr}{bx}{n}
122 \DeclareMathAlphabet {\mathsf} {OT1}{cmss}{m}{n}
123 \DeclareMathAlphabet {\mathit} {OT1}{cmr}{m}{it}
124 \DeclareMathAlphabet {\mathtt} {OT1}{cmtt}{m}{n}

```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```

125 \SetMathAlphabet\mathsf{bold}{OT1}{cmss}{bx}{n}
126 \SetMathAlphabet\mathit{bold}{OT1}{cmr}{bx}{it}

```

## 41.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```

127 \DeclareMathSizes{5}{5}{5}{5}
128 \DeclareMathSizes{6}{6}{5}{5}
129 \DeclareMathSizes{7}{7}{5}{5}
130 \DeclareMathSizes{8}{8}{6}{5}
131 \DeclareMathSizes{9}{9}{6}{5}
132 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
133 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
134 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
135 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
136 \DeclareMathSizes{\@xvipt}{\@xvipt}{\@xipt}{\@xpt}
137 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xipt}
138 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xvipt}

```

### 41.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by `IniTeX`. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

#### 41.3.1 The letters

```

139 \DeclareMathSymbol{a}{\mathalpha}{letters}{'a}
140 \DeclareMathSymbol{b}{\mathalpha}{letters}{'b}
141 \DeclareMathSymbol{c}{\mathalpha}{letters}{'c}
142 \DeclareMathSymbol{d}{\mathalpha}{letters}{'d}
143 \DeclareMathSymbol{e}{\mathalpha}{letters}{'e}
144 \DeclareMathSymbol{f}{\mathalpha}{letters}{'f}
145 \DeclareMathSymbol{g}{\mathalpha}{letters}{'g}
146 \DeclareMathSymbol{h}{\mathalpha}{letters}{'h}
147 \DeclareMathSymbol{i}{\mathalpha}{letters}{'i}
148 \DeclareMathSymbol{j}{\mathalpha}{letters}{'j}
149 \DeclareMathSymbol{k}{\mathalpha}{letters}{'k}
150 \DeclareMathSymbol{l}{\mathalpha}{letters}{'l}
151 \DeclareMathSymbol{m}{\mathalpha}{letters}{'m}
152 \DeclareMathSymbol{n}{\mathalpha}{letters}{'n}
153 \DeclareMathSymbol{o}{\mathalpha}{letters}{'o}
154 \DeclareMathSymbol{p}{\mathalpha}{letters}{'p}
155 \DeclareMathSymbol{q}{\mathalpha}{letters}{'q}
156 \DeclareMathSymbol{r}{\mathalpha}{letters}{'r}
157 \DeclareMathSymbol{s}{\mathalpha}{letters}{'s}
158 \DeclareMathSymbol{t}{\mathalpha}{letters}{'t}
159 \DeclareMathSymbol{u}{\mathalpha}{letters}{'u}
160 \DeclareMathSymbol{v}{\mathalpha}{letters}{'v}
161 \DeclareMathSymbol{w}{\mathalpha}{letters}{'w}
162 \DeclareMathSymbol{x}{\mathalpha}{letters}{'x}
163 \DeclareMathSymbol{y}{\mathalpha}{letters}{'y}
164 \DeclareMathSymbol{z}{\mathalpha}{letters}{'z}

165 \DeclareMathSymbol{A}{\mathalpha}{letters}{'A}
166 \DeclareMathSymbol{B}{\mathalpha}{letters}{'B}

```

```

167 \DeclareMathSymbol{C}{\mathalpha}{letters}{'C}
168 \DeclareMathSymbol{D}{\mathalpha}{letters}{'D}
169 \DeclareMathSymbol{E}{\mathalpha}{letters}{'E}
170 \DeclareMathSymbol{F}{\mathalpha}{letters}{'F}
171 \DeclareMathSymbol{G}{\mathalpha}{letters}{'G}
172 \DeclareMathSymbol{H}{\mathalpha}{letters}{'H}
173 \DeclareMathSymbol{I}{\mathalpha}{letters}{'I}
174 \DeclareMathSymbol{J}{\mathalpha}{letters}{'J}
175 \DeclareMathSymbol{K}{\mathalpha}{letters}{'K}
176 \DeclareMathSymbol{L}{\mathalpha}{letters}{'L}
177 \DeclareMathSymbol{M}{\mathalpha}{letters}{'M}
178 \DeclareMathSymbol{N}{\mathalpha}{letters}{'N}
179 \DeclareMathSymbol{O}{\mathalpha}{letters}{'O}
180 \DeclareMathSymbol{P}{\mathalpha}{letters}{'P}
181 \DeclareMathSymbol{Q}{\mathalpha}{letters}{'Q}
182 \DeclareMathSymbol{R}{\mathalpha}{letters}{'R}
183 \DeclareMathSymbol{S}{\mathalpha}{letters}{'S}
184 \DeclareMathSymbol{T}{\mathalpha}{letters}{'T}
185 \DeclareMathSymbol{U}{\mathalpha}{letters}{'U}
186 \DeclareMathSymbol{V}{\mathalpha}{letters}{'V}
187 \DeclareMathSymbol{W}{\mathalpha}{letters}{'W}
188 \DeclareMathSymbol{X}{\mathalpha}{letters}{'X}
189 \DeclareMathSymbol{Y}{\mathalpha}{letters}{'Y}
190 \DeclareMathSymbol{Z}{\mathalpha}{letters}{'Z}

```

#### 41.3.2 The digits

```

191 \DeclareMathSymbol{0}{\mathalpha}{operators}{'0}
192 \DeclareMathSymbol{1}{\mathalpha}{operators}{'1}
193 \DeclareMathSymbol{2}{\mathalpha}{operators}{'2}
194 \DeclareMathSymbol{3}{\mathalpha}{operators}{'3}
195 \DeclareMathSymbol{4}{\mathalpha}{operators}{'4}
196 \DeclareMathSymbol{5}{\mathalpha}{operators}{'5}
197 \DeclareMathSymbol{6}{\mathalpha}{operators}{'6}
198 \DeclareMathSymbol{7}{\mathalpha}{operators}{'7}
199 \DeclareMathSymbol{8}{\mathalpha}{operators}{'8}
200 \DeclareMathSymbol{9}{\mathalpha}{operators}{'9}

```

#### 41.3.3 Punctuation, brace, etc. keys

```

201 \DeclareMathSymbol{!}{\mathclose}{operators}{"21}
202 \DeclareMathSymbol{*}{\mathbin}{symbols}{"03} % \ast
203 \DeclareMathSymbol{+}{\mathbin}{operators}{"2B}
204 \DeclareMathSymbol{,}{\mathpunct}{letters}{"3B}
205 \DeclareMathSymbol{-}{\mathbin}{symbols}{"00}
206 \DeclareMathSymbol{.}{\mathord}{letters}{"3A}
207 \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
208 \DeclareMathSymbol{;}{\mathpunct}{operators}{"3B}
209 \DeclareMathSymbol{=}{\mathrel}{operators}{"3D}
210 \DeclareMathSymbol{?}{\mathclose}{operators}{"3F}

```

The following symbols are defined as delimiters below which automatically defines them as math symbols.

```

211 %\DeclareMathSymbol{(}{\mathopen}{operators}{"28}
212 %\DeclareMathSymbol{)}{\mathclose}{operators}{"29}
213 %\DeclareMathSymbol{/}{\mathord}{letters}{"3D}

```

```

214 %\DeclareMathSymbol{[]}{\mathopen}{operators}{"5B}
215 %\DeclareMathSymbol{[]}{\mathclose}{operators}{"5D}
216 %\DeclareMathSymbol{||}{\mathord}{symbols}{"6A}
217 %\DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
218 %\DeclareMathSymbol{>}{\mathrel}{letters}{"3E}

```

Should all of the following being activated by default? Probably not.

```

219 %\DeclareMathSymbol{\}{\mathopen}{symbols}{"66}
220 %\DeclareMathSymbol{\'}{\mathclose}{symbols}{"67}
221 %\DeclareMathSymbol{\}\'}{\mathord}{symbols}{"6E} % \backslash
222 \mathcode'\ = "8000 % \space
223 \mathcode\ ' = "8000 % ^\prime
224 \mathcode\ _ = "8000 % \_

```

#### 41.3.4 Delimitercodes for characters

[to be completed]

Finally, IniT<sub>E</sub>X sets all `\delcode` values to -1, except `\delcode' = 0`

```

225 \DeclareMathDelimiter{()}{\mathopen}{operators}{"28}{largesymbols}{"00}
226 \DeclareMathDelimiter{)}{\mathclose}{operators}{"29}{largesymbols}{"01}
227 \DeclareMathDelimiter{[]}{\mathopen}{operators}{"5B}{largesymbols}{"02}
228 \DeclareMathDelimiter{[]}{\mathclose}{operators}{"5D}{largesymbols}{"03}

```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain T<sub>E</sub>X. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```

229 \DeclareMathDelimiter{<}{\mathopen}{symbols}{"68}{largesymbols}{"0A}
230 \DeclareMathDelimiter{>}{\mathclose}{symbols}{"69}{largesymbols}{"0B}
231 \DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
232 \DeclareMathSymbol{>}{\mathrel}{letters}{"3E}

```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```

233 \DeclareMathDelimiter{/}{\mathord}{operators}{"2F}{largesymbols}{"0E}
234 \DeclareMathSymbol{/}{\mathord}{letters}{"3D}
235 \DeclareMathDelimiter{|}{\mathord}{symbols}{"6A}{largesymbols}{"0C}
236 \expandafter\DeclareMathDelimiter\@backslashchar
237 \mathord}{symbols}{"6E}{largesymbols}{"0F}

```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

## 41.4 Symbols accessed via control sequences

### 41.4.1 Greek letters

```

238 \DeclareMathSymbol{\alpha}{\mathord}{letters}{"0B}
239 \DeclareMathSymbol{\beta}{\mathord}{letters}{"0C}
240 \DeclareMathSymbol{\gamma}{\mathord}{letters}{"0D}
241 \DeclareMathSymbol{\delta}{\mathord}{letters}{"0E}
242 \DeclareMathSymbol{\epsilon}{\mathord}{letters}{"0F}
243 \DeclareMathSymbol{\zeta}{\mathord}{letters}{"10}
244 \DeclareMathSymbol{\eta}{\mathord}{letters}{"11}
245 \DeclareMathSymbol{\theta}{\mathord}{letters}{"12}
246 \DeclareMathSymbol{\iota}{\mathord}{letters}{"13}

```

```

247 \DeclareMathSymbol{\kappa}{\mathord}{letters}{"14}
248 \DeclareMathSymbol{\lambda}{\mathord}{letters}{"15}
249 \DeclareMathSymbol{\mu}{\mathord}{letters}{"16}
250 \DeclareMathSymbol{\nu}{\mathord}{letters}{"17}
251 \DeclareMathSymbol{\xi}{\mathord}{letters}{"18}

413 \DeclareMathSymbol{\rightharpoonup}{\mathrel}{letters}{"2A}
414 \DeclareMathSymbol{\rightharpoondown}{\mathrel}{letters}{"2B}

```

Here cometh much profligate robustification of math constructs. Warning: some of these commands may become non-robust if an AMS package is loaded.

Further potential problems: some math font packages may make unfortunate assumptions about some of these definitions that are not true of the robust versions we need.

```

415 \DeclareRobustCommand
416   \cong{\mathrel{\mathpalette@vereq\sim}} % congruence sign
417 \def\@vereq#1#2{\lower.5\p@\vbox{\lineskiplimit\maxdimen\lineskip-.5\p@
418   \ialign{${\m@th#1\hfil##\hfil$\crcr#2\crcr=\crcr}}}}
419 \DeclareRobustCommand
420   \notin{\mathrel{\m@th\mathpalette@cncel\in}}
421 \def\cncel#1#2{\m@th\oalign{${\hfil#1\mkern1mu/\hfil$\crcr$#1#2$}}
422 \DeclareRobustCommand
423   \rightleftharpoons{\mathrel{\mathpalette\rlh@{}}}
424 \def\rlh@#1{\vcenter{\m@th\hbox{\oalign{\raise2pt
425   \hbox{${#1\rightharpoonup$}\crcr
426   $#1\leftharpoondown$}}}}
427 \DeclareRobustCommand
428   \doteq{\buildrel\textstyle.\over=}

```

#### 41.4.6 Arrows

```

429 \DeclareRobustCommand
430   \joinrel{\mathrel{\mkern-3mu}}
431 \DeclareRobustCommand
432   \relbar{\mathrel{\smash-}} % \smash, because -
433   % has the same height as +

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet...`. This might be the case when packages are implementing shorthands for math, e.g. `=>` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathequalsign` and use this. However we can’t do this now as it would break other math layouts where characters are in different places (since those wouldn’t know about the need for a new command name).

```

434 \DeclareRobustCommand
435   \Relbar{\mathrel{=}}

```

```

436 \DeclareMathSymbol{\lhook}{\mathrel}{letters}{"2C}
437   \def\hookrightarrow{\lhook\joinrel\rightarrow}
438 \DeclareMathSymbol{\rhook}{\mathrel}{letters}{"2D}
439   \def\hookleftarrow{\leftarrow\joinrel\rhook}
440 \DeclareRobustCommand
441   \bowtie{\mathrel\triangleright\joinrel\mathrel\triangleleft}
442 \DeclareRobustCommand
443   \models{\mathrel{||}\joinrel\Relbar}
444 \DeclareRobustCommand
445   \Longrightarrow{\Relbar\joinrel\Rightarrow}

```

LaTeX Change: `\longrightarrow` and `\longleftarrow` redefined to make then robust.

```

446 \DeclareRobustCommand\longrightarrow
447   {\relbar\joinrel\rightarrow}
448 \DeclareRobustCommand\longleftarrow
449   {\leftarrow\joinrel\relbar}
450 \DeclareRobustCommand
451   \Longleftarrow{\Leftarrow\joinrel\Relbar}
452 \DeclareRobustCommand
453   \longmapsto{\mapstochar\longrightarrow}
454 \DeclareRobustCommand
455   \longleftrightarrow{\leftarrow\joinrel\rightarrow}
456 \DeclareRobustCommand
457   \Longleftrightarrow{\Leftarrow\joinrel\Rightarrow}
458 \DeclareRobustCommand
459   \iff{\;\Longleftrightarrow\;}

```

#### 41.4.7 Punctuation symbols

```

460 \DeclareMathSymbol{\ldotp}{\mathpunct}{letters}{"3A}
461 \DeclareMathSymbol{\cdotp}{\mathpunct}{symbols}{"01}
462 \DeclareMathSymbol{\colon}{\mathpunct}{operators}{"3A}

```

This is commented out, since `\ldots` is now defined in `ltoutenc.dtx`.

```

463 %\def\@ldots{\mathinner{\ldotp\ldotp\ldotp}}
464 %\DeclareRobustCommand\ldots
465 %   {\relax\ifmmode\@ldots\else\mbox{$\m@th\@ldots\,$}\fi}
466 \DeclareRobustCommand
467   \cdots{\mathinner{\cdotp\cdotp\cdotp}}
468 \DeclareRobustCommand
469   \vdots{\vbox{\baselineskip4\p@ \lineskiplimit\z@
470     \kern6\p@\hbox{.}\hbox{.}\hbox{.}}}
471 \DeclareRobustCommand
472   \ddots{\mathinner{\mkern1mu\raise7\p@
473     \vbox{\kern7\p@\hbox{.}}\mkern2mu
474     \raise4\p@\hbox{.}}\mkern2mu\raise\p@\hbox{.}\mkern1mu}}

```

#### 41.4.8 Math accents

```

475 \DeclareMathAccent{\acute}{\mathalpha}{operators}{"13}
476 \DeclareMathAccent{\grave}{\mathalpha}{operators}{"12}
477 \DeclareMathAccent{\ddot}{\mathalpha}{operators}{"7F}
478 \DeclareMathAccent{\tilde}{\mathalpha}{operators}{"7E}
479 \DeclareMathAccent{\bar}{\mathalpha}{operators}{"16}
480 \DeclareMathAccent{\breve}{\mathalpha}{operators}{"15}

```

```

481 \DeclareMathAccent{\check}{\mathalpha}{operators}{"14}
482 \DeclareMathAccent{\hat}{\mathalpha}{operators}{"5E}
483 \DeclareMathAccent{\vec}{\mathord}{letters}{"7E}
484 \DeclareMathAccent{\dot}{\mathalpha}{operators}{"5F}
485 \DeclareMathAccent{\widetilde}{\mathord}{largesymbols}{"65}
486 \DeclareMathAccent{\widehat}{\mathord}{largesymbols}{"62}

```

For some reason plain T<sub>E</sub>X never bothered to provide a ring accent in math (although it is available in the fonts), but since we got a request for it here we go:

```

487 \DeclareMathAccent{\mathring}{\mathalpha}{operators}{"17}

```

#### 41.4.9 Radicals

```

488 \DeclareMathRadical{\sqrtsign}{symbols}{"70}{largesymbols}{"70}

```

##### 41.4.10 Over and under something, etc

```

489 \def\overrightarrow#1{\vbox{\m@th\ialign{##\crcr
490     \rightarrowfill\crcr\noalign{\kern-\p@\nointerlineskip}

```

`\lgroup` There are three plain T<sub>E</sub>X delimiters which are not fully supported by NFSS,
`\rgroup` since they partly point into a bold cmr font. Allocating a full symbol font, just
`\bracevert` to have three delimiters seems a bit too much given the limited space available.
For this reason only the extensible sizes are supported. If this is not desired one
can use, without losing portability, define `\mathbf` and `\mathtt` as font symbol
alphabet (setting up `cmr/bx/n` and `cmtt/m/n` as symbol fonts first) and modify
the delimiter declarations to point with their small variant to those symbol fonts.
(This is done in `oldlfont.dtx` so look there for examples.)

```

563 \DeclareMathDelimiter{\lgroup} % extensible ( with sharper tips
564   {\mathopen}{largesymbols}"3A}{largesymbols}"3A}
565 \DeclareMathDelimiter{\rgroup} % extensible ) with sharper tips
566   {\mathclose}{largesymbols}"3B}{largesymbols}"3B}
567 \DeclareMathDelimiter{\bracevert} % the vertical bar that extends braces
568   {\mathord}{largesymbols}"3E}{largesymbols}"3E}

```

## 41.5 Math versions of text commands

The `\mathunderscore` here is really a text definition, so it has been put back into `ltoutenc.dtx` (by Chris, 30/04/97) and should be removed from here.

These symbols are the math versions of text commands such as `\P`, `\$`, etc.

```
\mathparagraph These math symbols are not in plain TEX.
\mathsection 569 \DeclareMathSymbol{\mathparagraph}{\mathord}{symbols}{"7B}
\mathdollar 570 \DeclareMathSymbol{\mathsection}{\mathord}{symbols}{"78}
\mathsterling 571 \DeclareMathSymbol{\mathdollar}{\mathord}{operators}{"24}
\mathunderscore 572 \def\mathsterling{\mathit{\mathchar"7024}}
573 \def\mathunderscore{\kern.06em\vbox{\hrule\@width.3em}}

\mathellipsis This is plain TEX's \ldots.
574 \def\mathellipsis{\mathinner{\ldotp\ldotp\ldotp}}%
```

## 41.6 Other special functions and parameters

### 41.6.1 Biggggg

```
575 </math>
576 <*math | latexrelease>
577 <latexrelease>\IncludeInRelease{2018/12/01}%
578 <latexrelease>          {\Big}{Start LR-mode}%
579 \def\big#1{\leavevmode@ifvmode
580   {\hbox{\$left#1\vbox to8.5\p@{\}right.\n@space$}}}
581 \def\Big#1{\leavevmode@ifvmode
582   {\hbox{\$left#1\vbox to11.5\p@{\}right.\n@space$}}}
583 \def\bigg#1{\leavevmode@ifvmode
584   {\hbox{\$left#1\vbox to14.5\p@{\}right.\n@space$}}}
585 \def\Bigg#1{\leavevmode@ifvmode
586   {\hbox{\$left#1\vbox to17.5\p@{\}right.\n@space$}}}
587 </math | latexrelease>
588 <latexrelease>\EndIncludeInRelease
589 <latexrelease>\IncludeInRelease{0000/00/00}%
590 <latexrelease>          {\Big}{Start LR-mode}%
591 <latexrelease>\def\big#1{{\hbox{\$left#1\vbox to8.5\p@{\}right.\n@space$}}}
592 <latexrelease>\def\Big#1{{\hbox{\$left#1\vbox to11.5\p@{\}right.\n@space$}}}
593 <latexrelease>\def\bigg#1{{\hbox{\$left#1\vbox to14.5\p@{\}right.\n@space$}}}
594 <latexrelease>\def\Bigg#1{{\hbox{\$left#1\vbox to17.5\p@{\}right.\n@space$}}}
595 <latexrelease>\EndIncludeInRelease
596 <*math>

597 \def\n@space{\nulldelimiterspace\z@ \m@th}
```

### 41.6.2 The log-like functions

```
\operator@font The \operator@font determines the symbol font used for log-like functions.
598 \def\operator@font{\mathgroup\symoperators}
```

### 41.6.3 Parameters

```
599 \thinmuskip=3mu
600 \medmuskip=4mu plus 2mu minus 4mu
601 \thickmuskip=5mu plus 5mu
```

This finishes the low-level setup in `fontmath.ltx`.  
602  $\langle$ /math)

## 42 Default cfg files

We provide default `cfg` files here to ensure that on installations that search large file trees we do not pick up some strange customisation files from somewhere.

```
603 (*cfgtext | cfgmath | cfgprel)
604 %%
605 %%
606 %%
607 %% Load the standard setup:
608 %%
609  $\langle$ +cfgtext) $\backslash$ input{fonttext.ltx}
610  $\langle$ +cfgmath) $\backslash$ input{fontmath.ltx}
611  $\langle$ +cfgprel) $\backslash$ input{preload.ltx}
612 %%
613 %% Small changes could go here; see documentation in cfgguide.tex for
614 %% allowed modifications.
615 %%
616 %% In particular it is not allowed to misuse this configuration file
617 %% to modify internal LaTeX commands!
618 %%
619 %% If you use this file as the basis for configuration please change
620 %% the  $\backslash$ ProvidesFile lines to clearly identify your modification, e.g.,
621 %%
622  $\langle$ +cfgtext) $\backslash$ ProvidesFile{fonttext.cfg}[2001/06/01
623  $\langle$ +cfgmath) $\backslash$ ProvidesFile{fonttext.cfg}[2001/06/01
624  $\langle$ +cfgprel) $\backslash$ ProvidesFile{preload.cfg}[2001/06/01
625 %% Customised local font setup]
626 %%
627 %%
628  $\langle$ /cfgtext | cfgmath | cfgprel)
```

## File u

# preload.dtx

## 43 Overview

This file contains an number of possible settings for preloading fonts during installation of NFSS2 (which is used by  $\text{\LaTeX} 2_{\epsilon}$ ). It will be used to generate the following files:

|              |                                                                |
|--------------|----------------------------------------------------------------|
| preload.min  | minimal subset of fonts necessary to run NFSS2                 |
| preload.ori  | preload of CM fonts similar to the old <code>lfonts.tex</code> |
| preload.ltx  | The standard selection of preloads                             |
| cmpreloa.xpt | preload of CM fonts for 10pt document size                     |
| cmpreloa.xip | preload of CM fonts for 11pt document size                     |
| cmpreloa.xii | preload of CM fonts for 12pt document size                     |
| dpreloa.xpt  | preload of DC fonts for 10pt size                              |
| dpreloa.xip  | preload of DC fonts for 11pt size                              |
| dpreloa.xii  | preload of DC fonts for 12pt size                              |

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

## 44 Customization

You can customize the preloaded fonts in your  $\text{\LaTeX} 2_{\epsilon}$  system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by `*all*`  $\text{\LaTeX} 2_{\epsilon}$  systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by  $\text{\LaTeX} 2.09$ .

If you normally use other fonts than Computer Modern `preload.min` might be best.

**Warning:** If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

## 45 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

|         |                                                         |
|---------|---------------------------------------------------------|
| driver  | produce a documentation driver file                     |
| preload | produce a preload... file                               |
| cm      | for OT1 encoded Computer Modern                         |
| dc      | for T1 encoded Computer Modern                          |
| min     | produce minimal subset                                  |
| xpt     | produce 10pt preloads                                   |
| xipt    | produce 11pt preloads                                   |
| xipt    | produce 12pt preloads                                   |
| ori     | produce preloads similar to old <code>lfonts.tex</code> |
| tex     | produce <code>preload.ltx</code>                        |

A typical DOCSTRIP command file would then have entries like:

```
\generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

## 46 A driver for this document

The next bit of code contains the documentation driver file for  $\TeX$ , i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
5   \DocInput{preload.dtx}
6 \end{document}
7 </driver>
```

## 47 The code

We begin by loading the math extension font (`cmex10`) and the  $\LaTeX$  line and circle fonts. It is necessary to do this explicitly since these are used by `lplain.tex` and `latex.tex`. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tenrc=lcircle10 \font\tenrcw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 (-tex)%*****
```

```

12 (-tex)% Start any modification below this point **
13 (-tex)%*****
14 (-tex)

# File v

## lftntcmd.dtx

### Abstract

The commands defined in this file `lftntcmd` are part of the kernel code for  $\text{\LaTeX} 2_{\epsilon}/\text{NFSS2}$ .

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

## 48 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the  $\text{T}_{\text{E}}\text{X}$  system and for several reasons it is better to avoid them on the user level whenever possible. In  $\text{\LaTeX}3$  they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text..`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.<sup>7</sup> The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,}
```

---

<sup>7</sup>Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

| <i>Command</i>           | <i>Corresponds to</i>  | <i>Action</i>                                |
|--------------------------|------------------------|----------------------------------------------|
| <code>\textrm{..}</code> | <code>\rmfamily</code> | Typeset argument in roman family             |
| <code>\textsf{..}</code> | <code>\sffamily</code> | Typeset argument in <b>sans serif</b> family |
| <code>\texttt{..}</code> | <code>\ttfamily</code> | Typeset argument in <b>typewriter</b> family |
| <code>\textmd{..}</code> | <code>\mdseries</code> | Typeset argument in medium series            |
| <code>\textbf{..}</code> | <code>\bfseries</code> | Typeset argument in <b>bold</b> series       |
| <code>\textup{..}</code> | <code>\upshape</code>  | Typeset argument in normal shape             |
| <code>\textit{..}</code> | <code>\itshape</code>  | Typeset argument in <i>italic</i> shape      |
| <code>\textsl{..}</code> | <code>\slshape</code>  | Typeset argument in <i>slanted</i> shape     |
| <code>\textsc{..}</code> | <code>\scshape</code>  | Typeset argument in SMALL CAPS shape         |
| <code>\emph{..}</code>   | <code>\em</code>       | Typeset argument <i>emphasized</i>           |

Table 1: Font-change commands with arguments

The font change commands provided here all start with `\text..` to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only
\emph{sometimes} one has to help \LaTeX{} by
adding a \verb=\nocorr= command.
```

which results in:

*When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L<sup>A</sup>T<sub>E</sub>X by adding a \nocorr command.*

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
{\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
\texttt{itemize} environment and NFSS
declarations.
\end{bfitemize}
```

This gives:

- **This environment produces boldface items.**

- It is defined in terms of L<sup>A</sup>T<sub>E</sub>X's `itemize` environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with `\/`.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a `\/` in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of `\/` in `amstex.sty` is used as this version can cause space to be removed immediately before the `\/`.

## 49 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text..` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automatically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimises this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other `aftergroup` tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```

1 (*2kernel)
2 \def \DeclareTextFontCommand #1#2{%
3   \DeclareRobustCommand#1[1]{%
4     \ifmmode
5       \nfss@text{#2##1}%
6     \else
7       \hmode@bgroup

```

```

8      \text@command{##1}%
9      #2\check@icl ##1\check@icr
10     \expandafter
11     \egroup
12     \fi
13         }%
14 }

```

`\textrm` Now we define the `\text{family}` commands in terms of the above; `\texttt` does not look very nice!

```

\texttt 15 \DeclareTextFontCommand{\textrm}{\rmfamily}
\textnormal 16 \DeclareTextFontCommand{\textsf}{\sffamily}
17 \DeclareTextFontCommand{\texttt}{\ttfamily}
18 \DeclareTextFontCommand{\textnormal}{\normalfont}

```

`\textbf` For the series attribute:

```

\textmd 19 \DeclareTextFontCommand{\textbf}{\bfseries}
20 \DeclareTextFontCommand{\textmd}{\mdseries}

```

`\textit` And for the shapes:

```

\textsl 21 \DeclareTextFontCommand{\textit}{\itshape}
\textsc 22 \DeclareTextFontCommand{\textsl}{\slshape}
\textup 23 \DeclareTextFontCommand{\textsc}{\scshape}
24 \DeclareTextFontCommand{\textup}{\upshape}

```

`\emph` Finally we have the `\em` font change declaration of L<sup>A</sup>T<sub>E</sub>X. The corresponding definition with argument is

```
25 \DeclareTextFontCommand{\emph}{\em}
```

`\nocorr` This is just a label, so it does nothing; it should also be unexpandable.

```
26 \let \nocorr \relax
```

`\check@icl` We define these defaults in case some error causes them to be expanded at the wrong time.

```
27 \let \check@icl \@empty
28 \let \check@icr \@empty
```

`\text@command` This checks for a `\nocorr` as the first token in its argument and also for one in any other position not protected within braces (the latter is treated as if it were at the end of the argument).

Is this the correct action in the ‘empty’ case? It is efficient but typographically it is, strictly, incorrect!

```

29 \def \text@command #1{%
30   \def \reserved@a {#1}%
31   \ifx \reserved@a \@empty
32     \let \check@icl \@empty
33     \let \check@icr \@empty
34   \else

```

`\space` is a reserved word in L<sup>A</sup>T<sub>E</sub>X or actually already in plain T<sub>E</sub>X. If somebody really redefines it so many things will break that I don’t see any reason to make this routine here slower than necessary.

```
35 %   \def \reserved@b { }%
```

```

36 % \ifx \reserved@a \reserved@b
37 \ifx \reserved@a \space
38 \let \check@ic1 \@empty
39 \let \check@icr \@empty
40 \else
41 \check@nocorr@ #1\nocorr\@nil
42 \fi
43 \fi
44 }
45 \def \check@nocorr@ #1#2\nocorr#3\@nil {%

```

The two checks are initialised here to their values in the normal case.

```

46 \let \check@ic1 \maybe@ic
47 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi}%
48 \def \reserved@a {\nocorr}%
49 \def \reserved@b {#1}%
50 \def \reserved@c {#3}%
51 \ifx \reserved@a \reserved@b
52 \ifx \reserved@c \@empty

```

In this case there is a `\nocorr` at the start but not at the end, so `\check@ic1` should be empty.

```

53 \let \check@ic1 \@empty
54 \else

```

Otherwise there is a `\nocorr` both at the start and elsewhere, so no italic corrections should be added.

```

55 \let \check@ic1 \@empty
56 \let \check@icr \@empty
57 \fi
58 \else
59 \ifx \reserved@c \@empty

```

In this case there is no `\nocorr` anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```

60 \else

```

In this case there is no `\nocorr` at the start but there is one elsewhere, so no `\aftergroup` is needed.

```

61 \let \check@icr \@empty
62 \fi
63 \fi
64 }

```

`\ifmaybe@ic` Switch used solely within `\maybe@ic` not interfering with other switches.

```

65 \newif\ifmaybe@ic

```

`\maybe@ic` These macros implement the italic correction.

```

\maybe@ic@
66 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
67 \def \maybe@ic@ {%

```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```

68 \ifdim \fontdimen\@ne\font>\z@
69 \else
70 \maybe@ictrue

```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```

71 \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
72 \nocorrlist

```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```

73 \do \t@st@ic

```

Frank thinks that the next bit it is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```

74 \ifmaybe@ic \sw@slant \fi
75 \fi
76 }

```

`\t@st@ic` The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```

77 \def \t@st@ic {%
78 \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
79 \ifx\reserved@b\@let@token

```

If they are the same we record the fact and jump out of the loop.

```

80 \maybe@icfalse
81 \@break@tfor
82 \fi
83 }

```

`\sw@slant` The definition of the mysterious `\sw@slant` command is as follows.  
`\fix@penalty`

```

84 \def \sw@slant {%

```

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```

85 \ifdim \lastskip=\z@
86 \fix@penalty
87 \else
88 \skip@ \lastskip
89 \unskip
90 \fix@penalty
91 \hskip \skip@

```

```

92 \fi
93 }

```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard  $\LaTeX$  code?

```

94 \def \fix@penalty {%
95   \ifnum \lastpenalty=\z@
96     \@@italiccorr
97   \else
98     \count@ \lastpenalty
99     \unpenalty
100    \@@italiccorr
101    \penalty \count@
102 \fi
103 }

```

`\nocorrlist` This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```
104 \def \nocorrlist {,.}
```

`\nfss@text` This command will by default behave like a  $\LaTeX$  `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```

105 \ifx \nfss@text\undefined
106   \def \nfss@text {\leavevmode\hbox}
107 \fi

```

`\DeclareOldFontCommand` This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{<font-change decls>} <math-alphabet>`

Here `\fn` is the font-declaration command being defined, `<font-change decls>` is the declaration it will expand to in text-mode, and `<math-alphabet>` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```

\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}

```

```

108 \def \DeclareOldFontCommand #1#2#3{%
109   \DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
110 }

```

`\@fontswitch` These two commands actually do the necessary tests and declarative font- or  
`\@@math@egroup` alphabet-changing.

```

\@@math@egroup
\@@math@egroup 111 \def \@fontswitch #1#2{%
112   \ifmmode
113     \let \math@bgroup \relax
114     \def \math@egroup {\let \math@bgroup \@@math@bgroup
115                       \let \math@egroup \@@math@egroup}%

```

We need to have a `\relax` in the following line in case the #2 is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```

116     #2\relax
117   \else
118     #1%
119   \fi
120 }
121 \let \@@math@bgroup \math@bgroup
122 \let \@@math@egroup \math@egroup

```

These commands are available only in the preamble.

```

123 \@onlypreamble \DeclareTextFontCommand
124 \@onlypreamble \DeclareOldFontCommand

```

## 50 Initialization

`\normalsize` This is defined to produce an error.

```

125 \def\normalsize{%
126   \@latex@error {The font size command \protect\normalsize\space
127                 is not defined:\MessageBreak
128                 there is probably something wrong with
129                 the class file}\@eha
130 }
131 </2ekernel)

```

# File w

## ltpageno.dtx

### 51 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering` The user sets the pagenumber style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```

1 (*2kernel)
2 \message{page nos.,}

3 \countdef\c@page=0 \c@page=1
4 \def\c1@page{ }
5 \def\pagenumbering#1{%
6   \global\c@page \@ne \gdef\thepage{\csname @#1\endcsname
7     \c@page}}
8 </2kernel>

```

## File x

# ltxref.dtx

## 52 Cross Referencing

The user writes `\label{foo}` to define the following cross-references:

`\ref{foo}`: value of most recently incremented referencable counter. in the current environment. (Chapter, section, theorem and enumeration counters counters are referencable, footnote counters are not.)

`\pageref{foo}`: page number at which `\label{foo}` command appeared. where `foo` can be any string of characters not containing ‘\’, ‘{’ or ‘}’.

Note: The scope of the `\label` command is delimited by environments, so `\begin{theorem} \label{foo} ... \end{theorem} \label{bar}` defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

### 52.1 Cross Referencing

```
1 (*2kernel)
2 \message{x-ref,}
```

This is implemented as follows. A referencable counter `CNT` is incremented by the command `\refstepcounter{CNT}`, which sets `\@currentlabel == {CNT}{eval(\p@cnt\theCNT)}`. The command `\label{FOO}` then writes the following on file `\@auxout` :

```
\newlabel{FOO}{{eval(\@currentlabel)}{eval(\thepage)}}
```

```
\ref{FOO} ==
BEGIN
  if \r@foo undefined
  then @refundefined := G T
      ??
      Warning: 'reference foo on page ... undefined'
  else \@car \eval(\r@FOO)\@nil
  fi
END
```

```
\pageref{foo} =
BEGIN
  if \r@foo undefined
  then @refundefined := G T
      ??
      Warning: 'reference foo on page ... undefined'
  else \@cdr \eval(\r@FOO)\@nil
  fi
END
```

`\G@refundefinedtrue` This does not save on name-space (since `\G@refundefinedfalse` was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

**Note** despite its name, `\G@refundefinedtrue` does *not* correspond to an `\if` command, and there is no matching `...false`. It would be more natural to call the command `\G@refundefined` (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a `\ref`-like command that mimicked the definition of `\ref`, calling `\G@refundefinedtrue`. Inspection of the  $\TeX$  archives revealed several such packages, and so this command has been named `...true` so that the definition of `\ref` need not be changed, and the packages will work without change.

```
3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7   \gdef\@refundefined{%
8     \@latex@warning@no@line{There were undefined references}}
9 \let\@refundefined\relax
```

`\ref` Referencing a `\label`. RmS 91/10/25: added a few extra `\reset@font`, as suggested by Bernd Raichle

`\pageref` RmS 92/08/14: made `\ref` and `\pageref` robust

`\setref` RmS 93/09/08: Added setting of `refundefined` switch.

```
10 \def\setref#1#2#3{%
11   \ifx#1\relax
12     \protect\G@refundefinedtrue
13     \nfss@text{\reset@font\bfseries ??}%
14     \@latex@warning{Reference '#3' on page \thepage \space
15       undefined}%
16   \else
17     \expandafter#2#1\relax
18   \fi}
19 \def\ref#1{\expandafter\setref\csname r@#1\endcsname\@firstoftwo{#1}}
20 \def\pageref#1{\expandafter\setref\csname r@#1\endcsname
21   \@secondoftwo{#1}}
```

`\newlabel` This command will be written to the `.aux` file to pass label information from one run to another.

`\@newl@bel` The internal form of `\newlabel` and `\bibcite`. Note that this macro does its work inside a group. That way the local assignments it needs to do don't clutter the save stack. This prevents large documents with many labels to run out of save stack.

```
22 \def\@newl@bel#1#2#3{%
23   \@ifundefined{#1#2}%
24     \relax
25     {\gdef \@multiplelabels {%
26       \@latex@warning@no@line{There were multiply-defined labels}}%
27       \@latex@warning@no@line{Label '#2' multiply defined}}%
28   \global\@namedef{#1#2}{#3}}
```

```

29 \def\newlabel{\@newl@bel r}
30 \@onlypreamble\@newl@bel
\if@multiplelabels This is redefined to produce a warning if at least one label is defined more than
\@multiplelabels once. It is executed by the \enddocument command.
31 \let \@multiplelabels \relax

\label The commands \label and \refstepcounter have been changed to allow
\refstepcounter \protect'ed commands to work properly. For example,

\def\thechapter{\protect\foo{\arabic{chapter}.\roman{section}}}

will cause a \label{bar} command to define \ref{bar} to expand to something
like \foo{4.d}. Change made 20 Jul 88.

32 \def\label#1{\@bsphack
33 \protected@write\@auxout{}%
34 {\string\newlabel{#1}{\@currentlabel}{\thepage}}}%
35 \@esphack}

36 \def\refstepcounter#1{\stepcounter{#1}%
37 \protected@edef\@currentlabel
38 {\csname p@#1\endcsname\csname the#1\endcsname}%
39 }

\@currentlabel For \label commands that come before any environment

40 \def\@currentlabel{}

41 </2kernel)

```

## 52.2 An extension of counter referencing

At the moment a reference to a counter `foo` will generate the equivalent of `\p@foo\thefoo` although not quite in this form. For some applications it would be nice if one could have `\thefoo` being an argument to `\p@foo` to be able to put material before and after the number generated by `\thefoo`. This can be easily achieved with a small change to one of the kernel commands as follows:

```

\def\refstepcounter#1{\stepcounter{#1}%
\protected@edef\@currentlabel
{\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
}

```

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the...`. With the kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

We have refrained from making this change in the kernel code although for existing documents it would be 100% backward compatible. The reason being

that any class or package making use of this functionality would then horribly fail with older L<sup>A</sup>T<sub>E</sub>X installations.

Instead we suggest that people who are interested in using this functionality in a document class or package add the redefinition to the class file. To ensure that this redefinition is properly applied they might want to test for the original definition first, e.g.

```
\CheckCommand*\refstepcounter[1]{\stepcounter{#1}%
\protected@edef\@currentlabel
{\csname p@#1\endcsname\csname the#1\endcsname}%
}
\renewcommand*\refstepcounter[1]{\stepcounter{#1}%
\protected@edef\@currentlabel
{\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
}
```

# File y

## ltmiscen.dtx

### 53 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`, The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1 (*2kernel)
2 \message{environments,}
```

#### 53.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@@end` is defined to be the `\end` command of T<sub>E</sub>X82.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end T<sub>E</sub>X in the middle.

```
\enddocument ==
BEGIN
\@checkend{document}    %% checks for unmatched \begin
\clearpage
\beginingroup
  if @filesw = true
  then close file @mainaux
  if G@refundefined = true

```

```
\@testdef
```

```

40 \def\@testdef #1#2#3{%
41   \def\reserved@a{#3}\expandafter \ifx \csname #1@#2\endcsname
42   \reserved@a \else \@tempswatrue \fi}

```

Reading data from auxiliary files (like `.toc` normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by `TEX` during that process.

However, especially the `.toc` file might be read in L-R mode (in cases the `\tableofcontents` attempts to put, say a list of sub-sections as a paragraph. In that case the newlines after a line like

```
\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}
```

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using `\endlinechar=-1` but that has the danger that it drops some valid endlines that should be converted to spaces (for example when the user edited the TOC and then used `\nofiles` to preserve it.

So the approach taken instead is this:

- `\addcontentsline` adds the command `\protected@file@percent` to the end of the second argument of `\@writefile` that is written to the `.aux`. As the name indicates this is a protected macro so it doesn't change if it is written out.
- When the `.aux` is read back in at the end of the run, `\@writefile` is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change `\@writefile` slightly: basically it looks at the second argument and if the last token in there is `\protected@file@percent` then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued `\addtocontents`, or from some package that uses `\@writefile` for writing its own files) then the command behaves exactly as before.

`\protected@file@percent` Dummy cs to be replaced by a percent sign inside `\@writefile`. If it survives (when used incorrectly) it will expand to nothing in a typesetting context.

```
43 \<2kernel>
44 (*2kernel | latexrelease)
45 (latexrelease)\IncludeInRelease{2018/12/01}%
46 (latexrelease)          {\protected@file@percent}{Mask line endings}%
47 \protected\def\protected@file@percent{}
```

`\add@percent@to@temptokena` Helper function which is used to inspect a sequence of tokens (the second argument of `\@writefile` and if the last token is `\protected@file@percent` it will replace it by a harmless percent. The result is saved in `\@temptokena` for later use.

```
48 \begingroup
49 \catcode'\%=12
```

`latexrelease` will read this code in high-speed mode in certain situations. During that it will only look for `\if` tests but not actually execute the `\catcode` change above. As a result it will drop anything after the `%` character in the definition. Therefore the `\fi` needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```
50 \catcode'\^^A=9
51 \long\gdef\add@percent@to@temptokena
52   #1\protected@file@percent#2\add@percent@to@temptokena
```

When we call this macro in `\@writefile` we stick in `\@empty` at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The `\expandafter` then expands this extra token away again.

```
53   {\ifx!#2!\@temptokena\expandafter{#1}\else
54     \@temptokena\expandafter{#1%\^^A
```

Can't be on the same line as the % — see above.

```

\@currentvline We do need a default value for \@currentvline on top-level since the document
environment cancels the brace group. This means that a mismatch with \begin

```

{document} will not produce a line number. Thus the outer default must be \@empty or we will end up with two spaces.

```
97 \let\@currenline\@empty
```

## 53.2 Center, Flushright, Flushleft

```
98 \message{center,}
```

```
\center, \flushright and \flushleft set
  \rightskip = Opt or \@flushglue (as appropriate)
  \leftskip  = Opt or \@flushglue (as appropriate)
  \parindent = Opt
  \parfillskip = Opt. (except \flushleft)
  \\\          == \par \vskip -\parskip
  \|[LENGTH] == \\\ \vskip LENGTH
  \\\*         == \par \penalty 10000 \vskip -\parskip
  \\\*[LEN]   == \\\* \vskip LENGTH
```

They invoke the trivlist environment to handle vertical spacing before and after them.

\centering, \raggedright and \raggedleft are the declaration analogs of the above.

\raggedright has a more universal effect, however. It sets \@rightskip := flushglue. Every environment, like the list environments, that set \rightskip to its 'normal' value set it to \@rightskip

```

### 53.3 Verbatim

```
123 \message{verbatim,}
```

The verbatim environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode'd` to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes `'...'` as its argument, and sets it verbatim in `\ttfamily` font.

The \*-variants of these commands are the same, except that spaces print as the T<sub>E</sub>Xbook's space character instead of as blank spaces.

```

\@vobeyspaces
124 {\catcode'\ =\active%
125 \gdef\@vobeyspaces{\catcode'\ \active\let \@xobeysp}}

181 \*2ekernel | latexrelease)
182 \latexrelease)\IncludeInRelease{2018/12/01}%
183 \latexrelease) \verbvisiblespace}{Setup visible space for verb}%

```

`\asciispace` The character in slot 32, in typewriter fonts (historically) a visible space but in other fonts a real space or something else

```

184 \DeclareRobustCommand\asciispace{\char 32 }

```

`\verbvisiblespace` This defines how to get a visible space in `\verb*` and friends. In classic T<sub>E</sub>X this is just the slot 32, but in TU encoded fonts we switch fonts and take the character from cmtt.

```

185 \ifx\Umathcode\@undefined
186 \let\verbvisiblespace\asciispace % Pdftex version
187 \else
188 \DeclareRobustCommand\verbvisiblespace
189 {\leavevmode{\usefont{OT1}{cmtt}{m}{n}\asciispace}} % xetex/luatex version
190 \fi

```

`\@setupverbvisiblespace` In pdfT<sub>E</sub>X a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In XeT<sub>E</sub>X or LuaT<sub>E</sub>X a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of `\verbvisiblespace` and if it is `\asciispace` we assume that the char32 can be used (e.g., in pdfT<sub>E</sub>X). We then redefine `\@xobeysp` so that after running `\@vobeyspaces` we get characters from slot 32 for each active space.

```

191 \def\@setupverbvisiblespace{%
192 \ifx\verbvisiblespace\asciispace
193 \let\@xobeysp\asciispace
194 \else

```

Otherwise we measure the width of a character in the mon-spaced current font and place a `\verbvisiblespace` into a box of the right width which we are then using as the character for a space. By default this will be the space character from OT1 cmtt but by changing `\verbvisiblespace` one could use, for example, the `\textvisiblespace` of the current typewriter font.

```

195 \setbox\z@\hbox{x}%
196 \setbox\@verbvisiblespacebox\hbox to\wd\z@{\hss\verbvisiblespace\hss}%
197 \def\@xobeysp{\leavevmode\copy\@verbvisiblespacebox}%
198 \fi
199 }

```

`\@verbvisiblespacebox` The box to hold the visible space character if it isn't in slot 32 in the current typewriter font.

```
200 \newbox\@verbvisiblespacebox
```

`\@sverb` Definitions of `\@sverb` and `\@verb` changed so `\verb+ foo+` does not lose leading blanks when it comes at the beginning of a line. Change made 24 May 89. Suggested by Frank Mittelbach and Rainer Schöpf.

```

201 \def\@sverb#1{%
202 \catcode'#1\active
203 \lccode'\~'#1%
204 \gdef\verb@balance@group{\verb@egroup
205 \@latexerror{\noexpand\verb illegal in command argument}\@ehc}%
206 \aftergroup\verb@balance@group
207 \lowercase{\let~\verb@egroup}%

```

If `\@sverb` is called from `\@verb` then space is already active and supposed to produce a real space. In this case we do nothing. Otherwise we run `\@setupverbvisiblespace` to setup the right visible space char and afterwards `\@vobeyspaces` to make it the definition for the active space character.

```

208 \ifnum\catcode'\ =\active
209 \else \@setupverbvisiblespace \@vobeyspaces \fi
210 }

```

`verbatim*` For `verbatim*` we also set up the correct visible space character definition and then run `\@vobeyspaces`. As this code is not called as part of the normal `verbatim` environment (the method is done the other way around this time) we don't have to check if space is already active—it shouldn't be.

```

211 \namedef{verbatim*}{\@verbatim
212 \@setupverbvisiblespace

## File z

# ltmath.dtx

## 54 Math setup

This file contains a lot of the original plain T<sub>E</sub>X code, as well as the L<sup>A</sup>T<sub>E</sub>X environments for math. It still needs sorting out.

```
1 (*2ekernel)
2 \message{math definitions,}
```

### 54.1 Math commands based on plain T<sub>E</sub>X

#### 54.1.1 The log-like functions

```
\log The standard operators:
3 \def\log{\mathop{\operator@font log}\nolimits}
4 \def\lg{\mathop{\operator@font lg}\nolimits}
5 \def\ln{\mathop{\operator@font ln}\nolimits}
6 \def\lim{\mathop{\operator@font lim}}
7 \def\limsup{\mathop{\operator@font lim\,sup}}
8 \def\liminf{\mathop{\operator@font lim\,inf}}
9 \def\sin{\mathop{\operator@font sin}\nolimits}
10 \def\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \def\sinh{\mathop{\operator@font sinh}\nolimits}
12 \def\cos{\mathop{\operator@font cos}\nolimits}
13 \def\arccos{\mathop{\operator@font arccos}\nolimits}
14 \def\cosh{\mathop{\operator@font cosh}\nolimits}
15 \def\tan{\mathop{\operator@font tan}\nolimits}
16 \def\arctan{\mathop{\operator@font arctan}\nolimits}
17 \def\tanh{\mathop{\operator@font tanh}\nolimits}
18 \def\cot{\mathop{\operator@font cot}\nolimits}
19 \def\coth{\mathop{\operator@font coth}\nolimits}
20 \def\sec{\mathop{\operator@font sec}\nolimits}
21 \def\csc{\mathop{\operator@font csc}\nolimits}
22 \def\max{\mathop{\operator@font max}}
23 \def\min{\mathop{\operator@font min}}
24 \def\sup{\mathop{\operator@font sup}}
25 \def\inf{\mathop{\operator@font inf}}
26 \def\arg{\mathop{\operator@font arg}\nolimits}
27 \def\ker{\mathop{\operator@font ker}\nolimits}
28 \def\dim{\mathop{\operator@font dim}\nolimits}
29 \def\hom{\mathop{\operator@font hom}\nolimits}
30 \def\det{\mathop{\operator@font det}}
31 \def\exp{\mathop{\operator@font exp}\nolimits}
32 \def\Pr{\mathop{\operator@font Pr}}
33 \def\gcd{\mathop{\operator@font gcd}}
34 \def\deg{\mathop{\operator@font deg}\nolimits}

\bmod And some operators have to be done by hand:
35 \def\bmod{%
36 \nonscript\mskip-\medmuskip\mkern5mu%
```

```

37 \mathbin{\operator@font mod}\penalty900\mkern5mu%
38 \nonscript\mskip-\medmuskip}

```

`\pmod`

```

39 \def\pmod#1{%
40 \allowbreak\mkern18mu({\operator@font mod}\,\,\#1)}

```

### 54.1.2 Biggggg

`\big` Variants on `\big` and friends for use with delimiters:

```

41 \def\bigl{\mathopen\big}
42 \def\bigm{\mathrel\big}
43 \def\biggr{\mathclose\big}
44 \def\Bigl{\mathopen\Big}
45 \def\Bigm{\mathrel\Big}
46 \def\Biggr{\mathclose\Big}
47 \def\biggl{\mathopen\bigg}
48 \def\biggm{\mathrel\bigg}
49 \def\biggr{\mathclose\bigg}
50 \def\Biggl{\mathopen\Bigg}
51 \def\Biggm{\mathrel\Bigg}
52 \def\Biggr{\mathclose\Bigg}

```

### 54.1.3 The UNSORTED Rest

The other math commands are lifted from plain T<sub>E</sub>X.

`\jot`

```

53 \newdimen\jot
54 \jot=3pt

```

`\interdisplaylinepenalty`

```

55 \newcount\interdisplaylinepenalty
56 \interdisplaylinepenalty=100

```

`\choose`

```

57 \def\choose{\atopwithdelims()}

```

`\brack`

```

58 \def\brack{\atopwithdelims[]}

```

`\brace`

```

59 \def\brace{\atopwithdelims\{\}}

```

`\mathpalette`

```

60 \def\mathpalette#1#2{%
61 \mathchoice
62   {#1\displaystyle{#2}}%
63   {#1\textstyle{#2}}%
64   {#1\scriptstyle{#2}}%
65   {#1\scriptscriptstyle{#2}}

```

```

\root
\rootbox 66 \newbox\rootbox
  \r@t    67 \def\root#1\of{%
        68 \setbox\rootbox\hbox{\m@th\scriptscriptstyle{#1}$}%

```

## 54.3 External options to the standard document classes

### 54.3.1 Left equation numbering

`\@eqnnum` To put the equation number on the left side of an equation we have to use a little trick. The number is shifted `\displaywidth` to the left inside a box of (approximately) zero width. This fails when the equation is too wide, the equation number than may overprint the equation itself.

```

343 (*leqno)
344 \renewcommand\@eqnnum{\hb@xt@.01\p@{}}%
345         \rlap{\normalfont\normalcolor
346         \hskip -\displaywidth(\theequation)}}
347 \endleqno)

```

### 54.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s displayed math environments.

`\mathindent` The amount of indentation of the equations is stored in a register.

```

348 (*fleqn)
349 \newdimen\mathindent

```

The setting of `\mathindent` has to be deferred until the class file has been processed, because `\leftmargini` is still 0pt wide at the moment `fleqn.clo` is read in.

```

350 \AtEndOfClass{\mathindent\leftmargini}

```

# ltlists.dtx

### 55 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{<LABEL>}{<COMMANDS>} ... \endlist
```

which can be invoked by the user as the list environment. The LABEL argument specifies item labeling. COMMANDS contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by ITEMLABEL. If the argument is missing, then the LABEL argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{<ITEMLABEL>}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{<ARG>} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item’s text. However, `\makelabel` can be `\let` to another command by the `\list`’s COMMANDS argument.

A `\usecounter{<foo>}` command in the second argument causes the counter `foo` to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `@endparenv` command.

Blank lines are ignored every other reasonable place–i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{...}\item\relax`. (Note the `\relax`, there in case the first character in the environment is a `'`.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a trivlist environment must have an argument—in many cases, this will be the null argument (`\item[]`). The trivlist environment is mainly used for paragraphing environments, like `verbatim`, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

## 55.1 List and Trivlist

The following variables are used inside a list environment:

`\totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\@mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\@inlabel` A switch that is false except between the time an `\item` is encountered and the time that `TEX` actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `@inlabel = true`, it holds the labels to be put out by `\everypar`.

`@nparitem` A switch set by `\list` when `@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`@nparlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\@item` commands.

`@nmbriest` Set true by `\usecounter` command, causes list to be numbered.

`\@listctr` `\def`'ed by `\usecounter` to name of counter.

`\@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like `tabbing` should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list`'s COMMANDS argument. These parameters are all TeX skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual TeX or L<sup>A</sup>T<sub>E</sub>X commands can be used to set them. The commands will be executed in vmode if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

## 55.2 Vertical Spacing (skips)

`\topsep`: Space between first item and preceding paragraph.

`\partopsep`: Extra space added to `\topsep` when environment starts a new paragraph (is called in vmode).

`\itemsep`: Space between successive items.

`\parsep`: Space between paragraphs within an item – the `\parskip` for this environment.

## 55.3 Penalties

`\@beginparpenalty`: put at the beginning of a list

`\@endparpenalty`: put at end of list

`\@itempenalty`: put between items.

## 55.4 Horizontal Spacing (dimens)

`\leftmargin`: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

`\rightmargin`: analogous.

`\listparindent`: extra indentation at beginning of every paragraph of a list except the one started by the `\item` command. May be negative! Usually, labeled lists have `\listparindent` equal to zero.

`\itemindent`: extra indentation added right BEFORE an item label.

`\labelwidth`: nominal width of box that contains the label. If the natural width of the label  $\leq$  `\labelwidth`, then the label is flushed right inside a box of width `\labelwidth` (with an `\hfil`). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

`\labelsep`: space between end of label box and text of first item.

## 55.5 Default Values

Defaults for the list environment are set as follows. First, `\rightmargin`, `\listparindent` and `\itemindent` are set to 0pt. Then, one of the commands `\@listi`, `\@listii`, ... , `\@listvi` is called, depending upon the current level of the list. The `\@list ...` commands should be defined by the document style. A convention that the document style should follow is to set `\leftmargin` to `\leftmargini`, ..., `\leftmarginvi` for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset.

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a `kern` to avoid a break point after the `parindent` box: the `skip` could cause a line-break if a very long label occurs in `raggedright` setting.

If `\noindent` was used after `\item` want to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```

185     {\setbox\z@\lastbox

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `\@nobreak` when it is true is now essential since now it is sometimes set locally.

## 55.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```
\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumi}
\def\labelenumii{(\theenumii)}
```

which will print the labels as '(a)', '(b)', ... and print a `\ref` as '3a'.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `\bullet`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@enumspaceing` and `\@enumdepth`.

```
\enumerate ==
BEGIN
  if \@enumdepth > 3
  then errormessage: "Too deeply nested".
  else \@enumdepth :=L \@enumdepth + 1
      \@enumctr :=L eval(enum@\romannumeral\the\@enumdepth)

|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\makebox</code>    | <code>\makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}</code><br>Puts <code>⟨obj⟩</code> in an <code>\hbox</code> of width <code>⟨wid⟩</code> , positioned by <code>⟨pos⟩</code> .<br>The possible <code>⟨pos⟩</code> are:<br>s stretched,<br>l flushleft,<br>r flushright,<br>c (default) centred.<br>If <code>⟨wid⟩</code> is missing, then <code>⟨pos⟩</code> is also missing and <code>⟨obj⟩</code> is put in an <code>\hbox</code> of its natural width.                                                                                                                                                                                                                                                                                                                                |
|                          | <code>\makebox(⟨x⟩,⟨y⟩)[⟨pos⟩]{⟨obj⟩}</code><br>Puts <code>⟨obj⟩</code> in an <code>\hbox</code> of width <code>x*\unitlength</code> and height <code>y*\unitlength</code> . <code>⟨pos⟩</code> arguments are <b>s</b> , <b>l</b> , <b>r</b> or <b>c</b> (default) for stretched, flushleft, flushright or centred, and <b>t</b> or <b>b</b> for top, bottom – or combinations like <b>tr</b> or <b>rb</b> . Default for horizontal and vertical are centered. Note that in this picture mode version of <code>\makebox</code> a <code>[b]</code> aligns on the <i>bottom</i> of the text as documented. If you want to align on the <i>baseline</i> use <code>\makebox( , ) [b]{\raisebox{0pt}{\height}[0pt]{xyz}}</code> or <code>\makebox( , ) [b]{\smash{xyz}}</code> |
| <code>\mbox</code>       | <code>\mbox{⟨obj⟩}</code> The same as <code>\makebox{⟨obj⟩}</code> , but is more efficient as no checking for optional arguments is done.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>\newsavebox</code> | <code>\newsavebox{⟨cmd⟩}</code> : If <code>⟨cmd⟩</code> is undefined, then defines it to be a T <sub>E</sub> X box register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>\savebox</code>    | <code>\savebox{⟨cmd⟩} ...</code> : <code>⟨cmd⟩</code> is defined to be a T <sub>E</sub> X box register, and the '...' are any <code>\makebox</code> arguments. It is like <code>\makebox</code> , except it doesn't produce text but saves the value in <code>\box ⟨cmd⟩</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>\sbox</code>       | <code>\sbox{⟨cmd⟩}{⟨obj⟩}</code> is an efficient abbreviation for <code>\savebox{⟨cmd⟩}{⟨obj⟩}</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>lrbox</code>       | <code>\begin{lrbox}{⟨cmd⟩}⟨text⟩\end{lrbox}</code> is equivalent to <code>\sbox{⟨cmd⟩}{⟨text⟩}</code> except that any white space at the beginning and end of <code>⟨text⟩</code> is ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>\framebox</code>   | <code>\framebox ...</code> : like <code>\makebox</code> , except it puts a 'frame' around the box. The frame is made of lines of thickness <code>\fboxrule</code> , separated by space <code>\fboxsep</code> from the text – except for <code>\framebox(X,Y) ...</code> , where the thickness of the lines is as for the picture environment, and there is no separation added.                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>\fbox</code>       | <code>\fbox{⟨obj⟩}</code> is an abbreviation for <code>\framebox{⟨obj⟩}</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>\parbox</code>     | <code>\parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩}</code> : Makes a box with <code>\hsize ⟨width⟩</code> , positioned by <code>⟨pos⟩</code> as follows: <b>c</b> : <code>\vcenter</code> (placed in <code>\$. . .\$</code> if not in math mode) <b>b</b> : <code>\vbox</code> <b>t</b> : <code>\vtop</code> default value is <b>c</b> . Sets <code>\hsize := ⟨width⟩</code> and calls <code>\@parboxrestore</code> , which does the following: Restores the original definitions of:                                                                                                                                                                                                                                                                            |

\baselineskip      = \normalbaselineskip
Calls \sloppy
Note: \@arrayparboxrestore same as \@parboxrestore but it doesn’t re-
store \\.
minipage      minipage : Similar to \parbox, except it also makes this look like a page by
setting
\textwidth == \columnwidth == box width
changes footnotes by redefining:
\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext
resets the following list environment parameters:
\@listdepth == \@mplistdepth
where \@mplistdepth is initialized to zero,
and executes \@minipagerestore to allow the document style to reset any
other parameters it desires. It sets @minipage true, and resets \everypar to set it
false. This switch keeps \addvspace from putting space at the top of a minipage.
Change added 24 May 89: \minipage sets @minipage globally; \endminipage
resets it false.
\rule          \rule[⟨raised⟩]{⟨width⟩}{⟨height⟩} : Makes a ⟨width⟩ * ⟨height⟩ rule, raised
⟨raised⟩.
\underline    \underline{⟨text⟩} : Makes an underlined hbox with ⟨text⟩ in it.
\raisebox     \raisebox{⟨distance⟩}[⟨height⟩][⟨depth⟩]{⟨box⟩} :
Raises ⟨box⟩ up by ⟨distance⟩ length (down if ⟨distance⟩ negative). Makes TEX
think that the new box extends ⟨height⟩ above the line and ⟨depth⟩ below, for a
total vertical length of ⟨height⟩+⟨depth⟩. Default values of ⟨height⟩ & ⟨depth⟩ =
actual height and depth of box in new position.

`\@arrayparboxrestore` Restore various paragraph parameters.

The rationale for allowing two normally global flags to be set locally here was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should

never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

```

`\@finalstrut` This macro adds a special strut the *depth* of the box given as `#1`, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect `\prevdepth` to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns. .

The `\nobreak` was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

```
400 \def\@finalstrut#1{%
401   \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}
```

## 56.1 Some low-level constructs

The following commands are basically inherited from plain T<sub>E</sub>X.

```
\leftline  These macros place text on a full line either centred or left or right adjusted.
\rightline 402 \def\@@line{\hb@xt@\hsize}
\centerline 403 \def\leftline#1{\@@line{#1\hss}}
\@@line     404 \def\rightline#1{\@@line{\hss#1}}
            405 \def\centerline#1{\@@line{\hss#1\hss}}

\rlap      These macros place text to the left or right of the current reference point without
\llap      taking up space.

406 \def\rlap#1{\hb@xt@\z@{#1\hss}}
407 \def\llap#1{\hb@xt@\z@{\hss#1}}

408 \</2kernel)
```

## 57 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L<sup>A</sup>T<sub>E</sub>X 2.09 version, not the extended version described in *The L<sup>A</sup>T<sub>E</sub>X Companion*. Use the `array` package to obtain the extended version.

### 57.1 tabbing

`\dimen{\@firsttab + i}` = distance of tab stop `i` from left margin  
 $0 \leq i \leq 15$  (?).

`\dimen\@firsttab` is initialized to `\@totalleftmargin`, so it starts at the prevailing left margin.

`\@maxtab` = number of highest defined tab register  
probably = `\@firsttab + 12`

`\@nxrtabmar` = tab stop number of next line’s left margin

`\@curtabmar` = tab stop number of current line’s left margin

`\@curtab` = number of the current tab. At start of line,  
it equals `\@curtabmar`

`\@hightab` = largest tab number currently defined.

`\@tabpush` = depth of `\pushtab`’s

`\box\@curline` = contents of current line, excluding left margin  
skip, and excluding contents of current field

`\box\@curfield` = contents of current field

`@rjfield` = switch: T iff the last field of the line should  
be right-justified at the right margin.

`\tabbingsep` = distance left by the `\` command between the  
current position and the field that is  
“left-shifted”.

#### UTILITY MACROS

`\@stopfield` : closes the current field

`\@addfield` : adds the current field to the current line.

`\@contfield` : continues the current field

`\@startfield` : begins the next field

`\@stopline` : closes the current line and outputs it

`\@startline` : starts the next line

`\@ifatmargin` : an `\if` that is true iff the current line.

has width zero

- \a The accents \‘ , \’ , and \= that have been redefined inside a tabbing environment can be called by typing \a‘ , \a’ , and \a=. The macro \a is defined in ltoutenc.dtx.

The ‘2ekernel’ code ensures that a \usepackage{autotabg} is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

## 57.2 array and tabular environments

ARRAY PARAMETERS:

`\arraycolsep`  
: half the width separating columns in an array environment

`\tabcolsep`  
: half the width separating columns in a tabular environment

`\arrayrulewidth`  
: width of rules

`\doublerulesep`  
: space between adjacent rules in array or tabular

`\arraystretch`  
: line spacing in array and tabular environments is done by placing a strut in every row of height and depth `\arraystretch` times the height and depth of the strut produced by an ordinary `\strut` command.

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

`l,r,c` : indicate where entry is to be placed.  
`|` : for vertical rule  
`@{EXP}` : inserts the text EXP in every column.  
`\arraycolsep` or `\tabcolsep` spacing is suppressed.  
`*{N}{PRE}` : equivalent to writing N copies of PRE in the preamble.  
PRE may contain `*{N'}{EXP'}` expressions.  
`p{LEN}` : makes entry in parbox of width LEN.

SPECIAL ARRAY COMMANDS:

`\multicolumn{N}{FORMAT}{ITEM}` : replaces the next N column items by ITEM, formatted according to FORMAT.

FORMAT should contain at most one l,r or c.

If it contains none, then ITEM is ignored.

`\vline` : draws a vertical line the height of the current row. May appear in an array element entry.

`\hline` : draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a `\\` command. If followed by another `\hline`, then adds a `\vskip` of `\doublerulesep`.

`\cline{i-j}` : draws horizontal lines between rows covering columns i through j, inclusive. Multiple commands may follow one another to provide lines covering several disjoint columns

`\extracolsep{WIDTH}` : for use inside an @ in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

151 \def\@tabular{\leavevmode \hbox \bgroup $\let\@acol\@tabacol
152 \let\@classz\@tabclassz
153 \let\@classiv\@tabclassiv \let\\\@tabularcr\@tabarray}

\@tabarray RmS 91/11/04 added \m@th.
154 \def\@tabarray{\m@th\ifnextchar[\@array{\@array[c]}}

    RmS 1993/11/03 changed \halign to \ialign and removed superfluous
    \tabskip assignment

  \@array
155 \def\@array[#1]#2{%
156 \if #1t\vtop \else \if#1b\vbox \else \vcenter \fi\fi
157 \bgroup

This next bit of code sets up the strut and then builds the halign and its preamble
according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to
expose what was a buglet in the previous version: since the \@arstrut below is
expanded and contains an \ifmmode then it could produce an unnecessary extra
box in every row, thus wasting 'lots of' main memory.

```

```

158 \setbox\@arstrutbox\hbox{%
159   \vrule \@height\arraystretch\ht\strutbox
160         \@depth\arraystretch \dp\strutbox
161         \@width\z@}%
162 \mkpream{#2}%
163 \edef\@preamble{%
164   \ialign \noexpand\@halignto
165     \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%

```

That is the end of setting up the preamble; now we reset things before executing the `\halign` built-up in `\@preamble`. The restorations could be done by introducing an extra group, thus saving tokens.

```

166 \let\@startpbox\@startpbox \let\@endpbox\@endpbox
167 \let\@tabularnewline\@%
168   \let\@par\@empty
169   \let\@sharp##%
170   \set@typeset@protect
171   \lineskip\z@skip\baselineskip\z@skip

```

If the parsing of the preamble goes wrong there may be some characters left which  $\TeX$  then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the `\halign` expects vertical mode thus issues a `\par` but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

```

172   \ifhmode \@preamerr\z@ \@@par\fi
173   \@preamble}

```

\endgroup
END

```

The command `\def\@addamp{}` was removed from `\multicolumn` on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the `\multicolumn` command had two column specifiers.

8 Feb 89 — `\hbox{}` added after `\@preamble` to correct bug that occurred if `\multicolumn` preceded `\\[D]` with  $D > 0$ , caused by `\\[]` command doing an `\unskip`, which removed `\tabcolsep` glue inserted by `\multicolumn`.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

Codes for classes and character numbers of array, tabular and multicolumn arguments.

| Character | Class | Number |
|-----------|-------|--------|
| c         | 0     | 0      |
| l         | 0     | 1      |

|         |   |   |
|---------|---|---|
| r       | 0 | 2 |
|         | 1 | - |
| @       | 2 | - |
| p       | 3 | - |
| {@-exp} | 4 | - |
| {p-arg} | 5 | - |

`\@testpach \foo` : expands `\foo`, which should be an array parameter token, and sets `\@chclass` and `\@chnum` to its class and number. Uses `\@lastchclass` to distinguish 4 and 5

Preamble error codes

0: 'illegal character'  
 1: 'Missing @-exp'

## ltpictur.dtx

### 58 Picture Mode

Picture mode commands. In addition to the commands available in L<sup>A</sup>T<sub>E</sub>X2.09, This section adds the new `\qbezier` command for drawing curves.

`\qbezier` `\qbezier[ $\langle N \rangle$ ]( $\langle AX,AY \rangle$ )( $\langle BX,BY \rangle$ )( $\langle CX,CY \rangle$ ) plots a quadratic Bezier curve from ( $\langle AX,AY \rangle$ ) to ( $\langle CX,CY \rangle$ ), with ( $\langle BX,BY \rangle$ ) as the third Bezier point, using  $N + 1$  points equally spaced parametrically. If  $N = 0$  (the default value), then a sufficient number of points are used to draw a connected curve—except that at most \qbeziermax + 1 points are drawn. A “point” is a square of side \@wholewidth.`

`\bezier` In addition, to be compatible with the old `bezier` package, a variant of this command, `\bezier`, is defined, in which the first argument is not optional.

```

\unitlength      = value of dimension argument
\@wholewidth     = current line width
\@halfwidth      = half of current line width
\@linefont       = font for drawing lines
\@circlefont     = font for drawing circles

```

```

\linethickness{DIM} : Sets the width of horizontal and vertical lines
                      in a picture to DIM. Does not change width of slanted lines
                      or circles. Width of all lines reset by \thinlines and
                      \thicklines

```

## CIRCLES AND OVALS

### USER COMMANDS:

`\circle{D}` : Produces the circle with the diameter as close as possible to  $D * \text{\unitlength}$ . `\put(X,Y){\circle{D}}` puts the circle with its center at (X,Y).

`\oval(X,Y)` : Makes an oval as round as possible that fits in the rectangle of width  $X * \text{\unitlength}$  and height  $Y * \text{\unitlength}$ . The reference point is the center.

`\oval(X,Y)[POS]` : Save as `\oval(X,Y)` except it draws only the half or quadrant of the oval indicated by POS. E.G., `\oval(X,Y)[t]` draws just the top half and `\oval(X,Y)[br]` draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified `\oval(X,Y)` command.

`\@ovvert {DELTA1} {DELTA2}` : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical rule. The width of the box will be `\@tempdima`.

DELTA1 and DELTA2 are added to the character number in `\@tempcnta` to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval. The width of the box will be `\@ovxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number of the top-right quarter circle with the largest diameter less than or equal to DIAM. Sets `\@tempboxa` to an hbox containing that character. Sets `\@tempdima` to `\wd \@tempboxa`, which is the distance from the circle's left outside edge to its right inside edge. (These characters are like those described in the

TeXbook, pp. 389-90.)

## ltthm.dtx

### 59 Theorem Environments

The user creates his own theorem-like environments with the command

```
\newtheorem{<name>}{<text>}[<counter>] or  
\newtheorem{<name>}[<oldname>]{<text>}
```

This defines the environment  $\langle name \rangle$  to be just as one would expect a theorem environment to be, except that it prints  $\langle text \rangle$  instead of “Theorem”.

If  $\langle oldname \rangle$  is given, then environments  $\langle name \rangle$  and  $\langle oldname \rangle$  use the same counter, so using a  $\langle name \rangle$  environment advances the number of the next  $\langle name \rangle$  environment, and vice-versa.

If  $\langle counter \rangle$  is given, then environment  $\langle name \rangle$  is numbered within  $\langle counter \rangle$ .

E.g., if  $\langle counter \rangle = \text{subsection}$ , then the first  $\langle name \rangle$  in subsection 7.2 is numbered  $\langle text \rangle$  7.2.1.

The way  $\langle name \rangle$  environments are numbered can be changed by redefining  $\backslash\text{the}\langle name \rangle$ .

#### DOCUMENT STYLE PARAMETERS

$\backslash\text{thmcounter}\{\text{COUNTER}\}$  : A command such that

```
\edef\theCOUNTER{\@thmcounter{COUNTER}}
```

defines  $\backslash\text{theCOUNTER}$  to produce a number for a theorem environment.

The default is:

```
BEGIN \noexpand\arabic{COUNTER} END
```

$\backslash\text{thmcountersep}$  : A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3,  $\backslash\text{thmcountersep}$  should be  $\backslash\text{def}'\text{ed}$  to ‘-’. Its default is ‘.’.

$\backslash\text{begintheorem}\{\text{NAME}\}\{\text{NUMBER}\}$  : A command that begins a theorem

environment for a ‘theorem’ named ‘NAME NUMBER’ – e.g.,  $\backslash\text{begintheorem}\{\text{Lemma}\}\{3.7\}$  starts Lemma 3.7.

$\backslash\text{opargbegintheorem}\{\text{NAME}\}\{\text{NUMBER}\}\{\text{OPARG}\}$  :

A command that begins a theorem environment for a ‘theorem’ named ‘NAME NUMBER’ with

optional

argument OPARG – e.g.,  $\backslash\text{begintheorem}\{\text{Lemma}\}\{3.7\}\{\text{Jones}\}$  starts ‘Lemma 3.7 (Jones)’.

$\backslash\text{endtheorem}$  : A command that ends a theorem environment.

$\backslash\text{newtheorem}\{\text{NAME}\}\{\text{TEXT}\}[\text{COUNTER}] ==$

```

BEGIN
  if \NAME is definable
    then \@definecounter{NAME}
    if COUNTER present
      then \@newctr{NAME}[COUNTER] fi
      \theNAME == BEGIN \theCOUNTER \@thmcountersep
        eval\@thmcounter{NAME}
    else \theNAME == BEGIN eval\@thmcounter{NAME} END
    \NAME == \@thm{NAME}{TEXT}
    \endNAME == \@endtheorem
  else error
  fi
END

\newtheorem{NAME}[OLDNAME]{TEXT}==
BEGIN
  if counter OLDNAME nonexistent
  then ERROR
  else
    if \NAME is definable
    then BEGIN
      \theNAME == \theOLDNAME
      \NAME == \@thm{OLDNAME}{TEXT}
      \endNAME == \@endtheorem
    END
    else error
  fi
fi
END

\@thm{NAME}{TEXT} ==
BEGIN
  \refstepcounter{NAME}
  if next char = [
    then \@ythm{NAME}{TEXT}
    else \@xthm{NAME}{TEXT}
  fi
END

\@xthm{NAME}{TEXT} ==
BEGIN
  \@begintheorem{TEXT}{\theNAME}
  \ignorespaces
END

\@ythm{NAME}{TEXT}[OPARG] ==
BEGIN
  \@opargbegintheorem{TEXT}{\theNAME}{OPARG}
  \ignorespaces

```

END

`\newtheorem` `\newtheorem` ought really be allowed only in the preamble Which would be good document style, and allow some main memory to be saved by declaring these commands to be `\onlypreamble`. Unfortunately the  $\LaTeX$  book indicates that `\newtheorem` may be used anywhere in the document...

# File F

## ltsect.dtx

### 60 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L<sup>A</sup>T<sub>E</sub>X kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 (*2kernel)
2 \message{title,}
```

#### 60.1 The Title

```
\title The user defines the title and author by the declarations \title{<name>},
\author \author{<name>}
\date Similarly the date is declared with \date{<date>}.
\thanks Inside these, the \thanks{<footnote text>} command may be used to make
\and acknowledgements, notice of address, etc. in a footnote. If there are multiple
\maketitle authors, they have to be separated with the \and command.
And finally, the \maketitle command produces the actual title, using the
information previously saved with the other commands.

\title \title for use in \maketitle. If not given \maketitle will produce an error
\@title message.
3 \def\title#1{\gdef\@title{#1}}
4 \def\@title{\@latex@error{No \noexpand\title given}\@ehc}

\author \author for use in \maketitle. If not given \maketitle will produce a warning
\@author message.
5 \def\author#1{\gdef\@author{#1}}
6 \def\@author{\@latex@warning@no@line{No \noexpand\author given}}

\date \date for use in \maketitle. If not given \maketitle will produce \today as the
\@date default.
7 \def\date#1{\gdef\@date{#1}}
8 \gdef\@date{\today}

\thanks
9 \def\thanks#1{\footnotemark
10 \protected@xdef\@thanks{\@thanks

17 \begin{tabular}[t]{c}}% % \end{tabular}

18 \message{sectioning,}

```

## 60.2 Sectioning

`\@secpenalty`

```

19 \newcount\@secpenalty
20 \@secpenalty = -300

```

`\ifnoskipsec` `\@noskipsectrue` Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true for the preamble and to false in `\document`. This was done to trap lists and related text in the preamble but it does not catch everything.

```

21 \newif\ifnoskipsec \@noskipsectrue

```

`\@startsection` The `\@startsection{<name>}{<level>}{<indent>}{<beforeskip>}{<afterskip>}{<style>}*[<altheading> ]{<heading>}` command is the mother of all the user level sectioning commands. The part after the \*, including the \* is optional.

**name:** e.g., 'subsection'

**level:** a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

**indent:** Indentation of heading from left margin

**beforeskip:** Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

**afterskip:** if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

**style:** Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as `\MakeUppercase` or `\fbox` that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, `\bfseries\MakeUppercase` would produce bold, uppercase headings.

If ‘\*’ is missing, then increment the counter. If it is present, then there should be no [`<altheading>`] argument. The command uses the counter ‘secnumdepth’. It contains a pointer to the highest section level that is to be numbered.

**Warning:** The `\@startsection` command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```

\def\foo{ \begingroup ...
           \paragraph{...}
           \endgroup}

```

```

```

## 60.3 Table of Contents etc.

### 60.3.1 Convention

`\tf@⟨foo⟩` = file number for output for table foo. The file is opened only if `@filesw = true`.

### 60.3.2 Commands

A `\l@⟨type⟩{⟨entry⟩}{⟨page⟩}` Macro needs to be defined by document style for making an entry of type `⟨type⟩` in a table of contents, etc. E.g., the document style should define `\l@chapter`, `\l@section`, etc.

**Note:** When the `\protect` command is used in the `⟨entry⟩` or `⟨text⟩` of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

**Surprise:** Inside an `\addcontentsline` or `\addtocontents` command argument, the commands: `\index`, `\glossary`, and `\label` are no-ops. This could cause a problem if the user puts an `\index` or `\label` into one of the commands he writes, or into the optional ‘short version’ argument of a `\section` or `\caption` command.

`\@starttoc` The `\@starttoc{⟨ext⟩}` command is used to define the commands: `\tableofcontents`, `\listoffigures`, etc.

For example: `\@starttoc{lof}` is used in `\listoffigures`. This command reads the `.⟨ext⟩` file and sets up to write the new `.⟨ext⟩` file.

```
\@starttoc{EXT} ==
BEGIN
  \begingroup
  \makeatletter
  read file \jobname.EXT
  IF @filesw = true
  THEN open \jobname.EXT as file \tf@EXT
  FI
```

```

        @nobreak :=G FALSE %% added 24 May 89
    \endgroup
END

```

```

132 \def\@starttoc#1{%
133 \begingroup
134 \makeatletter
135 \@input{\jobname.#1}%
136 \if@filesw
137 \expandafter\newwrite\csname tf@#1\endcsname
138 \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
139 \fi
140 \@nobreakfalse
141 \endgroup}

```

`\addcontentsline` The `\addcontentsline{<table>}{<type>}{<entry>}` command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry `\contentsline{<type>}{<entry>}{<page>}` to the `.<table>` file.

This macro is implemented as an application of `\addtocontents`. Note that `\thepage` is not expandable during `\protected@write` therefore one gets the page number at the time of the `\shipout`.

```

142 </2ekernel>
143 <*2ekernel | latexrelease>
144 (latexrelease)\IncludeInRelease{2018/12/01}%
145 (latexrelease) \addcontentsline{Mask line endings}%
146 \def\addcontentsline#1#2#3{%
147 \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}%

```

We add `\protected@file@percent` at the end which is turned on `\@writefile` into a percent character to mask the newline after the closing argument brace.

```

148 \protected@file@percent}}
149 </2ekernel | latexrelease>
150 (latexrelease)\EndIncludeInRelease

152 (latexrelease) \addcontentsline{Mask line endings}%
153 (latexrelease)\def\addcontentsline#1#2#3{%
154 (latexrelease) \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}
155 (latexrelease)\EndIncludeInRelease
156 <*2ekernel>

```

`\addtocontents` The `\addtocontents{<table>}{<text>}` command adds `<text>` to the `.<table>` file, with no page number.

```

157 \long\def\addtocontents#1#2{%
158 \protected@write\@auxout
159 {\let\label@gobble \let\index@gobble \let\glossary@gobble}%
160 {\string\@writefile{#1}{#2}}}

```

`\contentsline` The `\contentsline{<type>}{<entry>}{<page>}` macro produces a `<type>` entry in a table of contents, etc. It will appear in the `.toc` or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```
\contentsline{subsection}
```

The `\protect` command causes command sequences to be written without expanding them.

```
161 \def\contentsline#1{\csname l@#1\endcsname}
```

`\@dottedtocline{<level>}{<indent>}{<numwidth> }{<title>}{<page>}`: Macro to produce a table of contents line with the following parameters:

**level** If  $\langle level \rangle > \c@tocdepth$ , then no line produced.

**indent** Total indentation from the left margin.

**numwidth** Width of box for number if the  $\langle title \rangle$  has a `\numberline` command. As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

**title** Contents of entry.

**page** Page number.

Uses the following parameters, which must be set by the document style. They should be defined with `\def`'s.

**pnumwidth** Width of box in which page number is set.

**tocrmarg** Right margin indentation for all but last line of multiple-line entries.

**dotsep** Separation between dots, in mu units. Should be `\def`'d to a number like 2 or 1.7

`\@dottedtocline`

```
162 \kernel
163 (*kernel | latexrelease)
164 (latexrelease)\IncludeInRelease{2018/12/01}%
165 (latexrelease)          {\@dottedtocline}{Prevent protrusion}%
166 \def\@dottedtocline#1#2#3#4#5{%
167   \ifnum #1>\c@tocdepth \else
168     \vskip \z@ \@plus.2\p@
169     {\leftskip #2\relax \rightskip \@tocrmarg \parfillskip -\rightskip
170      \parindent #2\relax\@afterindenttrue
171      \interlinepenalty\@M
172      \leavevmode
173      \@tempdima #3\relax
174      \advance\leftskip \@tempdima \null\nobreak\hskip -\leftskip
175      {#4}\nobreak
176      \leaders\hbox{#5}\m@th
```

If a document uses fonts other than computer modern, the use of a dot from math can be very disturbing despite the fact that this might be the only place in a document that then uses computer modern. Therefore we surround the dot with an `\hbox` to escape to the surrounding text font.

```
177       \mkern \@dotsep mu\hbox{.}\mkern \@dotsep
178       mu$}\hfill
179       \nobreak
180       \hb@xt@\@pnumwidth{\hfil\normalfont \normalcolor #5%
```

We finish off by preventing any protrusion if that is enabled. If protrusion happens the number may shift to the right and as a result you may end up with an additional dot in the toc line in some situations.

```
181 \kern-\p@\kern\p@}%
182 \par}%
183 \fi}
```

`\noprotrusion` This command, if placed directly to the right (or left) of a word, will prevent prevent protrusion of that word into the margin. It is used in the toc entry lines as they shouldn't protrude. It is implemented as to kerns that cancel each other but being there hide the word so that protrusion is not added. Note that a zero kern or an empty box would not work as the protrusion mechanism will skip over those.

```
184 \DeclareRobustCommand\noprotrusion{\leavevmode\kern-\p@\kern\p@}

211 </2ekernel>
```

# File G

## lfloat.dtx

### 61 Floats

The different types of floats are identified by a  $\langle type \rangle$  name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each  $\langle type \rangle$  has associated a positive  $\langle type\ number \rangle$ , which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a  $\langle placement\ specifier \rangle$ , which is a list of the possible locations, each denoted by a letter as follows:

h : here — at the current location in the text.  
t : top — at the top of a text page.  
b : bottom — at the bottom of a text page.  
p : page — on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

#### 61.1 Floating Environments

```
1 (*2kernel)
2 \message{floats,}
```

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

`\c@topnumber` : Number of floats allowed at the top of a column.  
`\topfraction` : Fraction of column that can be devoted to floats.  
`\c@dbltopnumber, \dbltopfraction`  
: Same as above, but for double-column floats.  
`\c@bottomnumber, \bottomfraction`  
: Same as above for bottom of page.  
`\c@totalnumber` : Number of floats allowed in a single column,  
including in-text floats.  
`\textfraction` : Minimum fraction of column that must contain text.  
`\floatpagefraction`: Minimum fraction of page that must be taken  
up by float page.  
`\dblfloatpagefraction`  
: Same as above, for double-column floats.

The document style must define the following.

`\fps@TYPE` : The default placement specifier for floats of type TYPE.

`\ftype@TYPE` : The type number for floats of type TYPE.

`\ext@TYPE` : The file extension indicating the file on which the contents list for float type TYPE is stored.  
For example, `\ext@figure = 'lof'`.

`\fnum@TYPE` : A macro to generate the figure number for a caption.  
For example, `\fnum@TYPE == Figure \thefigure`.

`\@makecaption{NUM}{TEXT}` :  
A macro to make a caption, with NUM the value produced by `\fnum@...` and TEXT the text of the caption. It can assume it's in a `\parbox` of the appropriate width.

`\@float{TYPE}[PLACEMENT]` : This macro begins a float environment for a  
single-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is defined by `\fps@TYPE`. The environment is ended by `\end@float`.  
E.g., `\figure == \@float{figure}, \endfigure == \end@float`.

```

\@float{TYPE}[PLACEMENT] ==
BEGIN
  if hmode then \@bsphack
    \@floatpenalty := -10002
  else \@floatpenalty := -10003
  fi
  \@capytype ==L TYPE
  \@dblflset
  \@fps ==L PLACEMENT
  \@onelevel@sanitize \@fps
  add default PLACEMENT if at most ! in PLACEMENT ==
  \@fpsadddefault
  if inner
    then LaTeX Error: 'Not in outer paragraph mode.'
    \@floatpenalty := 0
  else if \@freelist nonempty
    then \@currbox :=L head of \@freelist
    \@freelist :=G tail of \@freelist
    \@count\@currbox :=G 32*\ftype@TYPE +
      bits determined by
  PLACEMENT
  else \@floatpenalty := 0
    LaTeX Error: 'Too many unprocessed floats'
  fi

```

```

fi
\@currbox :=G \color@vbox
\normalcolor
\ vbox{
%% 15 Dec 87 -
%% removed \boxmaxdepth :=L 0pt
%% that made box 0 depth because it screwed
%% things up. Instead, added \vskip0pt at
end
\hsize = \columnwidth
\@parboxrestore
\@floatboxreset
END

```

```

\caption ==
BEGIN
\refstepcounter{\@capttype}
\@dblarg{\caption{\@capttype}}
END

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\@caption{TYPE}[STEXT]{TEXT} ==
BEGIN
\par
\addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
\begingroup
\@parboxrestore
\@normalsize
\@makecaption{\fnum@TYPE}{TEXT}
\par
\endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'. The environment is ended by `\end@dblfloat`.  
E.g., `\figure*` == `\@dblfloat{figure}`,  
`\endfigure*` == `\end@dblfloat`.

```

\@dblfloat{TYPE}[PLACEMENT] ==

```

Identical to `\@float{TYPE}[PLACEMENT]` except `\hsize` and `\linewidth` are set to `\textwidth`.

`\@floatpenalty`

```
3 \newcount\@floatpenalty
```

`\caption` This is set to be an error message outside a float since no `capttype` is defined there; this may need to be changed by some classes.

```
4 \def\caption{%
5   \ifx\@capttype\undefined
6     \latex@error{\noexpand\caption outside float}\@ehd
7     \expandafter\@gobble
8   \else
9     \refstepcounter\@capttype
10    \expandafter\@firstofone
11   \fi
12   {\@dblarg{\@caption\@capttype}}%
13 }
```

`\@caption`

```
14 \long\def\@caption#1[#2]#3{%
15   \par
16   \addcontentsline{\csname ext@#1\endcsname}{#1}%
17   {\protect\numberline{\csname the#1\endcsname}{\ignorespaces #2}}%
18   \begingroup
```

The paragraph setting parameters are normalised at this point, however `\@parboxrestore` resets `\everypar` which is not correct in this context so `\@setminipage` is called if needed.

The float mechanism, like `minipage`, sets the flag `@minipage` true before executing the user-supplied text. Many  $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$  constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates  $\text{T}_{\text{E}}\text{X}$ 's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of `\everypar`, but the call to `\@parboxrestore` removes that redefinition, so it is re-inserted if needed. If the flag is already false then the `\caption` was not the first entry in the float, and so some other paragraph has already activated the special `\everypar`. In this case no further action is needed.

```
19   \@parboxrestore
20   \if@minipage
21     \@setminipage
22   \fi
23   \normalsize
24   \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par
25   \endgroup}
```

`\@float`

`\@dblflset`

```
26 \def\@float#1{%
27   \@ifnextchar[%
28     {\@xfloat{#1}}%
29     {\edef\reserved@a{\noexpand\@xfloat{#1}[\csname fps@#1\endcsname]}}%
30     \reserved@a}}
```

`\@dblfloat`

```
31 \def\@dblfloat{%
32 \if@twocolumn\let\reserved@a\@dbflt\else\let\reserved@a\@float\fi
33 \reserved@a}
```

`\fps@dbl` Note that all double floats have default fps ‘tp’.

`\@setfps` This sets the fps, dealing with error conditions by adding the default.

`\@xfloat` The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters. It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

`\@floatboxreset` The rationale for allowing these normally global flags to be set locally here, via `\@parboxrestore`, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

```

#### MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the \output routine. Marginal notes are distinguished from floats by having a negative placement specification. The command \marginpar [LTEXT]{RTEXT} generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

\marginparwidth : Width of marginal notes.  
\marginparsep : Distance between marginal note and text.  
the page layout to determine how to move the marginal  
note into the margin. E.g., \leftmargin skip ==  
\hskip -\marginparwidth \hskip -\marginparsep .

`\marginparpush` : Minimum vertical separation between `\marginpar`'s

Marginal notes are normally put on the outside of the page if `@mparswitch = true`, and on the right if `@mparswitch = false`. The command `\reversemarginpar` reverses the side where they are put. `\normalmarginpar` undoes `\reversemarginpar`. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```
\marginpar [LTEXT]{RTEXT} ==
BEGIN
  if hmode then \bsphack
    \floatpenalty := -10002
  else \floatpenalty := -10003
  fi
  if inner

329 \long\def\@ympar#1{%
330   \@savemarbox\@marbox{#1}%
331   \global\setbox\@currbox\copy\@marbox
332   \@xympar}
```

`\@savemarbox`

```
333 \long\def \@savemarbox #1#2{%
334   \global\setbox #1%
335     \color@vbox
336     \vtop{%
337       \hsize\marginparwidth
338       \@parboxrestore
339       \@marginparreset
340       #2%
341       \@minipagefalse
342       \outer@nobreak
343     }%
344   \color@endbox
345 }
```

`\@marginparreset`

The rationale for allowing these normally global flags to be set locally here, via `\@parboxrestore` was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

```

346 \def \@marginparreset {%
347     \reset@font
348     \normalsize
349 %     \let@if@nbreak\iffalse
350 %     \let@if@noskipsec\iffalse
351 %     \@setnbreak
352     \@setminipage
353 }

```

`\@xympar`

Setting the box here is done only because the code uses `\end@float`; it will be empty and gets discarded.

```

354 \def \@xympar{%

## 61.2 Footnotes

`\footnote{NOTE}` : User command to insert a footnote.

`\footnote[NUM]{NOTE}`: User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered \*, \*\*, etc. within pages, then `\footnote[2]{...}` produces footnote '\*\*'. This command does not step the footnote counter.

`\footnotemark[NUM]` : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

`\footnotetext[NUM]{TEXT}` : Command to produce the footnote but no mark. `\footnote` is equivalent to `\footnotemark \footnotetext .`

As in PLAIN, footnotes use `\insert\footins`, and the following parameters:

`\footnotesize` : Size-changing command for footnotes.

`\footnoteseq` : The height of a strut placed at the beginning of every footnote.

`\skip\footins` : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height `\footnoteseq` which is at the beginning of the first footnote.

`\footnoterule` : Macro to draw the rule separating footnotes from text. It is executed right after a `\vspace` of `\skip\footins`. It should take zero vertical space—i.e., it should to a negative skip to compensate for any positive space it occupies. (See PLAIN.TEX.)

`\interfootnotelinepenalty` : Interline penalty for footnotes.

`\thefootnote` : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an `\@addtoreset` command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.

`\@thefnmark` : Holds the current footnote’s mark—e.g., `\dag` or `'1'` or `'a'`.

`\@mpfnnumber` : A macro that generates the numbers for `\footnote` and `\footnotemark` commands. It == `\thefootnote` outside a minipage environment, but can be changed inside to generate numbers for `\footnote`’s.

`\@makefnmark` : A macro to generate the footnote marker from `\@thefnmark`. The default definition was `\hbox{${\@thefnmark}}`.

This is now replaced by `\textsuperscript{\@thefnmark}`

`\@makefntext{NOTE}` :  
 Must produce the actual footnote, using `\@thefnmark` as the mark of the footnote and NOTE as the text. It is called when effectively inside a `\parbox`, with `\hsize = \columnwidth`.  
 For example, it might be as simple as  
`~{\@thefnmark}$ NOTE`

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

- (a) they use the counter `mpfootnote`
- (b) the footnotes they produce go at the bottom of the minipage.

The switch is accomplished by letting `\@mpfn == footnote` or `mpfootnote` and `\thempfn == \thefootnote` or `\themppfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the minipage.

```

\footnote{NOTE} ==

## ltbibl.dtx

### 63 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The `BIBTEX` program will create a file containing such an environment, which will be read in by the `\bibliography` command. With `BIBTEX`, the following commands will be used.

`\bibliography`     `\bibliography{⟨file1,file2, …,filen⟩}` : specifies the bibdata files. Writes a `\bibdata` entry on the `.aux` file and tries to read in `mainfile.bbl`.

`\bibliographystyle`     `\bibliographystyle{⟨style⟩}` : Writes a `\bibstyle` entry on the `.aux` file.

`thebibliography`     The `thebibliography` environment is a list environment. To save the use of an extra counter, it should use `enumiv` as the item counter. Instead of using `\item`, items in the bibliography are produced by the following commands:

`\bibitem{⟨name⟩}` : Produces a numbered entry cited as `⟨name⟩`.

`\bibitem[⟨label⟩]{⟨name⟩}` : Produces an entry labeled by `⟨Label⟩` and cited by `⟨name⟩`.

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

`\cite`     Entries are cited by the command `\cite{⟨name⟩}`.

`\nocite`     `\nocite{⟨citations⟩}` puts information on the `.aux` file that causes `BIBTEX` to include the `{⟨citations⟩}` list in the bibliography, but puts nothing in the text.

`\nocite{*}` is special: it tells `BIBTEX` to put the whole of a collection of references into the bibliography.

```

#### PARAMETERS

`\@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}` command, where entry `FOOi` is defined by `\bibitem[LABELi]{FOOi}`. The switch `@tempswa` is true if the optional `NOTE` argument is present.

The default definition is :

```
\@cite{LABELS}{NOTE} ==
  BEGIN [LABELS
    IF @tempswa = T THEN , NOTE FI
  ]
END
```

`\@biblabel` : A macro to produce the label in the bibliography entry. For `\bibitem[LABEL]{NAME}`, the label is generated by `\@biblabel{LABEL}`. It has the default definition `\@biblabel{LABEL} -> [LABEL]`.

#### CONVENTION

`\b@FOO` : The name or number of the reference created by `\cite{FOO}`  
 E.g., if `\cite{FOO} -> [17]` , then `\b@FOO -> 17`.

```

\bibitem
3 \def\bibitem{\@ifnextchar[\@lbibitem\@bibitem}

\@lbibitem
4 \def\@lbibitem[#1]#2{\item[\@biblabel{#1}\hfill]\if@filesw
5     {\let\protect\noexpand
6     \immediate
7     \write\@auxout{\string\bibcite{#2}{#1}}}\fi\ignorespaces}

\@bibitem
8 \def\@bibitem#1{\item\if@filesw \immediate\write\@auxout
9     {\string\bibcite{#1}{\the\value{\@listctr}}}\fi\ignorespaces}

12 \DeclareRobustCommand\cite{%
13   \@ifnextchar [{\@tempswatrue\@citex}{\@tempswafalse\@citex[]}]

\@citex \penalty\@m added to definition of \@citex to allow a line break after the ‘,’ in
citations like [Jones80,Smith77] (Added 23 Oct 86)
space added after the ‘,’ (21 Nov 87)
14 \def\@citex[#1]#2{\leavevmode
15   \let\@citea\@empty
16   \@cite{\@for\@citeb:=#2\do
17     {\@citea\def\@citea{\penalty\@m\ }%
18     \edef\@citeb{\expandafter\@firstofone\@citeb\@empty}}%
19   \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}}\fi

```

Using `\hbox` instead of `\mbox` is fine because of the `\leavevmode` above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arsenau. Note that this one is inside the first argument of the `\@cite` hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

20     \@ifundefined{b@\@citeb}{\hbox{\reset@font\bfseries ?}}%
21     \G@refundefinedtrue
22     \@latex@warning
23     {Citation ‘\@citeb’ on page \thepage \space undefined}}%
24     {\@cite@ofmt{\csname b@\@citeb\endcsname}}{#1}}

```

`\bibdata`

```

\bibstyle 25 \let\bibdata=\@gobble
          26 \let\bibstyle=\@gobble

```

`\bibliography`

```

27 \def\bibliography#1{%
28   \if@filesw
29     \immediate\write\@auxout{\string\bibdata{\zap@space#1 \@empty}}%
30   \fi
31   \@input@{\jobname.bbl}}

```

`\bibliographystyle`

```

32 \def\bibliographystyle#1{%
33   \ifx\@begindocumenthook\@undefined\else
34     \expandafter\AtBeginDocument
35   \fi
36   {\if@filesw
37     \immediate\write\@auxout{\string\bibstyle{#1}}%
38   \fi}}

```

`\nocite` (Added 14 Jun 85)

This puts information on the `.aux` file that causes `BIBTEX` to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for `\nocite` like that for `\@citex`, to get rid of leading spaces.

```

39 \def\nocite#1{\@bsphack

```

With the implementation designed already in `LATEX 2.09` the `\nocite` command will not work before `\begin{document}` since it tries to write to the `.aux` file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

This would be easy to fix, but then a document using the fix will silently fail on an older release of `LATEX`, missing all citations done with `\nocite`. Thus we do only generate an error message and leave the fix for a `LATEX 2ε` successor.

```

40   \ifx\@onlypreamble\document

```

Since we are after `\begin{document}` we can do the citations:

```

41     \@for\@citeb:=#1\do{%
42       \edef\@citeb{\expandafter\@firstofone\@citeb}%
43       \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi
44       \@ifundefined{b@\@citeb}{\G@refundefinedtrue
45         \@latex@warning{Citation ‘\@citeb’ undefined}}{}}%
46   \else

```

But before `\begin{document}` we raise an error message:

```
47 \latex@error{Cannot be used in preamble}\@eha
```

Without the compatibility problems we could fix the problem as follows:

```
48 % \AtBeginDocument{\nocite{#1}}
49 \fi
50 \esphack}
```

Since `\nocite{*}` should not produce a warning about undefined citation keys (see PR 557), we need to set the control sequence ‘`\b@*`’ to something other than `\relax`. As a result `\cite{*}` will not warn either (but that never worked with `LATEX` in the first place).

```
51 \xdef\let\csname b@*\endcsname\@empty
```

### 63.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

`\@cite`

```
52 \def\@cite#1#2{[#1\if@tempwa , #2\fi]}
```

`\@cite@ofmt`

This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of `b@ \@citeb`; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

```
53 \let\@cite@ofmt\hbox
```

`\@biblabel`

```
54 \def\@biblabel#1{[#1]}
55 </2kernel>
```

# ltpage.dtx

## 64 Page styles and related commands

### 64.1 Page Style Commands

`\pagestyle{<style>}` : sets the page style of the current and succeeding pages to *style*

`\thispagestyle{<style>}` : sets the page style of the current page only to *style*.

To define a page style *style*, you must define `\ps@style` to set the page style parameters.

### 64.2 How a page style makes running heads and feet

The `\ps@...` command defines the macros `\@oddhead`, `\@oddfoot`, `\@evenhead`, and `\@evenfoot` to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, etc., where `\chaptermark{<text>}` is called by `\chapter` to set a mark. The `\...mark` commands and the `\...head` macros are defined with the help of the following macros.

(All the `\...mark` commands should be initialized to no-ops.)

### 64.3 marking conventions

L<sup>A</sup>T<sub>E</sub>X extends T<sub>E</sub>X's `\mark` facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

`\markboth{<left>}{<right>}` : Adds both marks.

`\markright{<right>}` : Adds a 'right' mark.

`\leftmark` : Used in the output routine, gets the current 'left' mark. Works like T<sub>E</sub>X's `\botmark`.

`\rightmark` : Used in the output routine, gets the current 'right' mark. Works like T<sub>E</sub>X's `\firstmark`. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if 2 `\markboth`'s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\@mkboth` command, which is `\let` by the `pagestyle` command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

1 (\*2kernel)

`\pagestyle` User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \@ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}}
```

`\thispagestyle` User command to set the page style for this page only.

```

6 \def\thispagestyle#1{%
7   \@ifundefined{ps@#1}%
8     \undefinedpagestyle
9     {\global\@specialpagetrue\gdef\@specialstyle{#1}}

```

`\ps@empty` The empty page style: No head or foot line.

```

10 \def\ps@empty{%
11   \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12   \let\@evenhead\@empty\let\@evenfoot\@empty}

```

`\ps@plain` The plain page style: No head, centred page number in foot.

```

13 \def\ps@plain{\let\@mkboth\@gobbletwo
14   \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15   \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}

```

`\@leftmark` We implement `\@leftmark` and `\@rightmark` in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.

```

16 \let\@leftmark\@firstoftwo
17 \let\@rightmark\@secondoftwo

```

`\markboth` User commands for setting L<sup>A</sup>T<sub>E</sub>X marks.

`\markright` Test for `\@nobreak` added 15 Apr 86 in `\markboth` and `\markright` letting `\label` and `\index` to `\relax` added 22 Feb 86 so these commands can appear in sectioning command arguments RmS 91/06/21 Same for `\glossary`

```

18 \def\markboth#1#2{%
19   \begingroup
20     \let\label\relax \let\index\relax \let\glossary\relax
21     \unrestored@protected@xdef\@themark {#{1}#{2}}%
22     \@temptokena \expandafter{\@themark}%
23     \mark{\the\@temptokena}%
24   \endgroup
25   \if@nobreak\ifvmode\nobreak\fi\fi}
26 \def\markright#1{%
27   \begingroup
28     \let\label\relax \let\index\relax \let\glossary\relax

```

Protection is handled inside `\@markright`.

```

29     \expandafter\@markright\@themark {#1}%
30     \@temptokena \expandafter{\@themark}%
31     \mark{\the\@temptokena}%
32   \endgroup
33   \if@nobreak\ifvmode\nobreak\fi\fi}

```

`\@markright`

```

\leftmark 34 \def\@markright#1#2#3{\@temptokena {#1}%
\rightmark 35 \unrestored@protected@xdef\@themark{\the\@temptokena}{#3}}
36 \def\leftmark{\expandafter\@leftmark\botmark\@empty\@empty}
37 \def\rightmark{\expandafter\@rightmark\firstmark\@empty\@empty}

```

`\@themark` Initialise L<sup>A</sup>T<sub>E</sub>X's marks without setting a T<sub>E</sub>X mark (*whatsit*).

```

38 \def\@themark{}{}

```

`\mark` Test versions of L<sup>A</sup>T<sub>ε</sub>X initialised T<sub>E</sub>X's `\mark` system at this point, but this was removed before the first release.

```
\AtBeginDocument{\mark{}}}
```

`\raggedbottom` `\raggedbottom` typesets pages with no vertical stretch, so they have their natural height instead of all being exactly the same height. (Uses a space of .0001fil to avoid interfering with the 1fil space of `\newpage`.)

```
39 \def\raggedbottom{%
40 \def\@textbottom{\vskip \z@ \@plus.0001fil}\let\@texttop\relax}
```

`\flushbottom` `\flushbottom`: Inverse of `\raggedbottom` — makes all pages the same height.

```
41 \def\flushbottom{%
42 \let\@textbottom\relax \let\@texttop\relax}
```

`\sloppy` `\sloppy` will never (well, hardly ever) produce overfull boxes, but may produce underfull ones. (14 June 85)

```
43 \def\sloppy{%
44 \tolerance 9999%
45 \emergencystretch 3em%
46 \hfuzz .5\p@
47 \vfuzz\hfuzz}
```

`sloppypar` A `sloppypar` environment is equivalent to `{\par \sloppy ... \par}`.

```
48 \def\sloppypar{\par\sloppy}
49 \def\endsloppypar{\par}
```

`\fussy` Resets T<sub>E</sub>X's parameters to their normal finicky values.

```
50 \def\fussy{%
51 \emergencystretch\z@
52 \tolerance 200%
53 \hfuzz .1\p@
54 \vfuzz\hfuzz}
```

`\overfullrule` L<sup>A</sup>T<sub>ε</sub>X default is no overfull box rule. Changed by document class option.

```
55 \overfullrule 0pt

56 </2ekernel)
```

# File K

## ltoutput.dtx

### 65 Output Routine

#### 65.1 Floats

The ‘2ekernel’ code ensures that a `\usepackage{autoout1}` is essentially ignored if a ‘full’ format is being used that has the autoloading file mode already in the format.

```
1 \def\begingroup
2 \def\makeatletter
3 \def\nfss@catcodes
4 \if2ekernel\expandafter\let\csname ver@autoout1.sty\endcsname\fmtversion
5 \if2ekernel
6 \message{output,}
   *****
   *                OUTPUT                *
   *****
```

#### PAGE LAYOUT PARAMETERS

```
\topmargin      : Extra space added to top of page.
@twoside        : boolean. T if two-sided printing
\oddsidemargin  : IF @twoside = T
                  THEN extra space added to left of odd-numbered
                  pages.
                  ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                  THEN extra space added to left of
even-numbered
                  pages.
\headheight     : height of head
\headsep        : separation between head and text
\footskip       : distance separation between baseline of last
                  line of text and baseline of foot.
                  Note difference between \footSKIP and \headSEP.
\textheight     : height of text on page, excluding head and foot
\textwidth      : width of printing on page
\columnsep      : IF @twocolumn = T
                  THEN width of space between columns
\columnseprule  : IF @twocolumn = T
                  THEN width of rule between columns (0 if none).
\columnwidth    : IF @twocolumn = T
                  THEN (\textwidth - \columnsep)/2
                  ELSE \textwidth
                  It is set by the \twocolumn and
```

`\onecolumn` commands.

`\@textbottom` : Command executed at bottom of vbox holding text of page (including figures). The `\raggedbottom` command almost `\let`'s this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.

`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

#### PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.

`\textfloatsep` : Space between last top float or first bottom float and the text.

`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)

`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.

`\intextsep` : Space left on top and bottom of an in-text float.

`\dblfloatsep` : Space between double-column floats.

`\dbltextfloatsep` : Space between top double-column floats and text.

`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.

`\@fptop` : Glue to go at top of float column – must be 0pt + stretch

`\@fpsep` : Glue to go between floats in a float column.

`\@fpbot` : Glue to go at bottom of float column  
– must be 0pt + stretch

`\@dblfpptop`, `\@dblfpsep`, `\@dblfpbot`  
: Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

#### PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

## PAGE STYLE MACROS AND SWITCHES

`\@oddhead` : IF @twoside = T  
THEN macro to generate head of  
odd-numbered  
pages.  
ELSE macro to generate head of all pages.

`\@evenhead` : IF @twoside = T  
THEN macro to generate head of  
even-numbered  
pages.

`\@oddfoot` : IF @twoside = T  
THEN macro to generate foot of  
odd-numbered  
pages.  
ELSE macro to generate foot of all pages.

`\@evenfoot` : IF @twoside = T  
THEN macro to generate foot of  
even-numbered  
pages.

`@specialpage` : boolean. T if current page is to have a special  
format.

`\@specialstyle` : If its value is foo then  
IF @specialpage = T  
THEN the command `\ps@foo` is executed to  
temporarily reset the page style parameters  
before composing the current page.  
This command should execute only `\def`'s  
and  
`\edef`'s, making only local definitions.

## FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.  
When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

\* For single-column page it equals `\textheight`.

\* For double-column page it equals `\textheight - height`  
of double-column floats on page.

Note that some are set globally and some locally:

`\@topnum` :=G Maximum number of floats allowed on the top of a  
column.

`\@toproom` :=G Maximum amount of top of column devoted to floats—  
excluding `\textfloatsep` separation below the floats  
and `\floatsep` separation between them. For  
two-column output, should be computed as a function  
of `\@colht`.

`\@botnum`, `\@botroom`  
: Analogous to above.

`\@colnum` :=G Maximum number of floats allowed in a column, including in-text floats.

`\@textmin` :=L Minimum amount of text (excluding footnotes) that must appear on a text page.  
 %% 27 Sep 85 : made local to  
 %% `\@addtocurcol` and `\@addtonextcol`  
 It is now also used locally in processing double floats.

`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\@dblfloatplacement` sets the following parameters.

`\@dbltopnum` :=G Maximum number of double-column floats allowed at  
 at  
 the top of a two-column page.

`\@dbltoproom` :=G Maximum height of double-column floats allowed at top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

`\@fptop` :=L `\@dblfpptop`

`\@fpsep` :=L `\@dblfpsep`

`\@fpbot` :=L `\@dblfpbot`

#### OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column style, it equals `\textheight`. In two-column style, it is `\textheight` minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO `\textheight`.

`\@colroom` : The height available in the current column for text and footnotes. It equals `\@colht` minus the height of all floats committed to the top and bottom of the current column.

`\@textfloatsheight` : The total height of in-text floats on the current page.

`\@footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set when any routine sets `\maxdepth`.

#### CALLING THE OUTPUT ROUTINE

---

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty  $<$  or  $= -10000$  in the output list. In the latter case, the penalty indicates why the output

routine was called, using the following code.

| penalty | reason                                                                           |
|---------|----------------------------------------------------------------------------------|
| -10000  | <code>\pagebreak</code><br><code>\newpage</code>                                 |
| -10001  | <code>\clearpage</code> ( <code>\penalty -10000 \vbox{} \penalty -10001</code> ) |
| -10002  | float insertion, called from horizontal mode                                     |
| -10003  | float insertion, called from vertical mode.                                      |
| -10004  | float insertion.                                                                 |

Note: A float or marginpar puts the following sequence in the output list: (i) a penalty of -10004, (ii) a null `\vbox` (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

## THE OUTPUT ROUTINE

### FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.

Also sets `\@colht :=G \textheight`.

The page style is determined as follows.

```
IF @thispagestyle = true
THEN use \thispagestyle style
ELSE use ordinary page style.
```

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:

```
\@colht : height of box
\@fpmin : minimum height of floats in the box
\@fpsep : interfloat space
\@fptop : glue at top of box
\@fpbot : glue at bottom of box.
```

If it succeeds, then it does the following:

```
* \@outputbox :=L the composed float box.
* @fcolmade :=G true
* \FLIST :=G \FLIST - floats put in box
* \@freelist :=G \@freelist + floats put in box
```

If it fails, then:

```
* @fcolmade :=G false
```

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :  
 Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

- \* Globally sets `\@toplist` and `\@botlist` to floats from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\@textfraction`.
- \* Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolumn` :  
 Calls `\@tryfcolumn\@dbldeferlist{8}`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:

- \* Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\@textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
- \* Globally sets `\@colht` to `\@textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box `\@outputbox` with the floats from `\@toplist` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\@floatsep` and `\@textfloatsep` for the appropriate separations. It puts the elements of `\@TOPLIST` and `\@BOTLIST` onto `\@freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplist` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\@maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`. If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht :=G \@textheight`, and calls `\@floatplacement`.

If @twocolumn = true, then:

If @firstcolumn = true, then it puts box \@outputbox into \@leftcolumn and sets @firstcolumn :=G false.

If @firstcolumn = false, then it puts out the current two-column page, any possible two-column float pages, and determines \@dbltoplist for the next page.

## USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

---

```
\newpage == BEGIN \par\vfil\penalty -10000 END
```

```
\clearpage == BEGIN \newpage
                \write -1{}      % Part of hack to make sure no
                \vbox{}          % \write's get lost.
                \penalty -10001
            END
```

```
\cleardoublepage == BEGIN \clearpage
                        if @twoside = true and c@page is even
                        then \hbox{} \newpage fi
            END
```

`\twocolumn[BOX]` : starts a new page, changing to twocolumn setting and puts BOX in a parbox of width `\textwidth` across the top. Useful for full-width titles for double-column pages.

SURPRISE: The stretch from `\@dbltextfloatsep` will be inserted between the BOX and the top of the two columns.

## FLOAT-HANDLING MECHANISMS

---

The float environment obtains an insertion number B from the `\@freelist` (see below for a description of list manipulation), puts the float into box B and sets `\count B` to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts B onto the `\@dbldeferlist`.

The float specifier has two components:

- \* A PLACEMENT SPECIFICATION, describing where the float may be placed.
- \* A TYPE, which is a power of two—e.g., figures might be

type 1 floats, tables type 2 floats, programs type 4 floats, etc. The float specifier is encoded as follows, where bit 0 is the least significant bit.

| Bit | Meaning                                              |
|-----|------------------------------------------------------|
| 0   | 1 iff the float may go where it appears in the text. |
| 1   | 1 iff the float may go on the top of a page.         |
| 2   | 1 iff the float may go on the bottom of a page.      |
| 3   | 1 iff the float may go on a float page.              |
| 4   | 1 unless the PLACEMENT includes a !                  |
| 5   | 1 iff a type 1 float                                 |
| 6   | 1 iff a type 2 float                                 |
|     | etc.                                                 |

A negative float specifier is used to indicate a marginal note.

### MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

```
\@elt \boxa ... \@elt \boxN
```

where `\boxI` is defined by

```
\newinsert\boxI
```

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEMPTY}{EMPTY} == % NOTE: ASSUME
\@elt = \relax
  BEGIN assume that \LIST == \@elt \B1 ... \@elt \Bn
    if n = 0
      then EMPTY
    else \CS :=L \B1
        \LIST :=G \@elt \B2 ... \@elt \Bn
        NONEMPTY
    fi
  END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all `I` of bit `log2 \NUM` of the float specifiers of all the floats in `\LIST`.

I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit `log2 \NUM` of its float specifier equal to 1.

Note:  $\log_2 [(\backslash\text{count I})/32]$  is the bit number corresponding to the type of float I. To see if there is any float in `\LIST` having the same type as float I, you run `\@bitor` with  $\backslash\text{NUM} = [(\backslash\text{count I})/32] * 32$ .

```
\@bitor\NUM\LIST ==
BEGIN
  @test :=G false
  { \@elt \CTR == if \NUM <> 0 then
                    if \count\CTR / \NUM is odd
                    then @test := true          fi fi
  \LIST
  }
END
```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```
\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
        \LIST :=G \LIST \@elt \NUM
      }
```

#### BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

`\@freelist` : List of empty boxes for placing new floats.  
`\@toplist` : List of floats to go at top of current column.  
`\@midlist` : List of floats in middle of current column.  
`\@botlist` : List of floats to go at bottom of current column.  
`\@deferlist` : List of floats to go after current column.  
`\@dbltoplist` : List of double-col. floats to go at top of current page.  
`\@dbldeferlist` : List of double-column floats to go on subsequent pages.

#### FLOAT-PLACEMENT ALGORITHMS

`\@addtobot` : Tries to put insert `\@currbox` on `\@botlist`.

Called only when:

- \*  $\backslash\text{ht BOX} < \backslash\text{colroom}$
- \* type of `\@currbox` not on `\@deferlist`
- \*  $\backslash\text{colnum} > 0$
- \* `@insert = false`

If it succeeds, then:

- \* sets `@insert true`
- \* decrements `\@botroom` by  $\backslash\text{ht BOX}$
- \* decrements `\@botnum` and `\@colnum` by 1

```

                                * decrements \@colroom by \ht BOX + either
\floatsep
                                or \textfloatsep, as appropriate.
                                * sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                  \@botlist.
                  Called only under same conditions as \@addtobot.
                  If it succeeds, then:
                    * sets @insert true
                    * decrements \@toproom or \@botroom by \ht
BOX
                    * decrements \@colnum and either \@topnum or
                    \@botnum by 1
                    * decrements \@colroom by \ht BOX +
\floatsep
                                or \textfloatsep, as appropriate.

\@addtocurcol : Tries to add \@currbox to current column, setting
                @insert true if it succeeds, false otherwise.
                It will add \@currbox to top only if bit 0 of
                \count \@currbox is 0, and to the bottom only if
                bit 0 = 0 or an earlier float of the same type is
                put on the bottom.
                If the float is put in the text, then
                \penalty\interlinepenalty is put
                right after the float, before the following \vskip,
                and \outputpenalty :=L 0.

\@addtonextcol : Tries to add \@currbox to the next column, setting
                @insert true if it succeeds, false otherwise.

\@addtodblcol : Tries to add \@currbox to the next double-column page,
                adding it to \@dbltoplist if it succeeds and
                \@dbldeferlist if it fails.

\@addmarginpar ==
BEGIN
  if \@currlist nonempty
  then remove \@marbox from \@currlist
        add \@marbox and \@currbox to \@freelist

82 \newdimen\columnseprule
83 \newdimen\marginparwidth
84 \newdimen\marginparsep
85 \newdimen\marginparpush
```

```
\AtBeginDvi We use a box register in which to put stuff that must appear before anything else
\@beginvibox in the .dvi file.
```

The stuff in the box should not add any typeset material to the page when it is unboxed.

```
86 \newbox\@beginvibox
87 \def \AtBeginDvi #1{%
88   \global \setbox \@beginvibox
89   \vbox{\unvbox \@beginvibox #1}%
90 }
```

```
\@maxdepth This is not the right place to set this; it needs to be set in a class/style file when
\maxdepth is set.
```

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```
91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth
```

```
\paperheight New \paper... registers.
```

```
\paperwidth 93 \newdimen\paperheight
94 \newdimen\paperwidth
```

```
\if@insert Local switches first:
```

```
\if@fcolmade 95 \newif \if@insert
```

```
\if@specialpage These should definitely be global:
```

```
\if@firstcolumn 96 \newif \if@fcolmade
\if@twocolumn 97 \newif \if@specialpage \@specialpagefalse
\if@twoside
```

```
\if@reversemarginpar
\if@mparswitch
\col@number
```

These should be global but are not always set globally in other files.

```
98 \newif \if@firstcolumn \@firstcolumntrue
99 \newif \if@twocolumn \@twocolumnfalse
```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```

165   \if@nobreak \@nobreakfalse \everypar{}\fi
166   \par

```

The `\vfil` at the end of the macro before the break penalty will normally result in the page being run short, even with `\flushbottom` in effect (in contrast to the behavior of `\pagebreak`). However, if there is some explicit stretch on the page, say, a `\vfill`, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of `\prevdepth` is no longer taken into account by T<sub>E</sub>X. So we back up by that amount (or by `\maxdepth` if it is really huge), to mimic the normal behavior without the `\newpage`.

```

167   \ifdim\prevdepth>\z@
168     \vskip -%

```

```

197 (*2ekernel | fltrace)

```

`\@emptycol` It may be better to use an invisible rule rather than an empty box here.

```
198 \def \@emptycol {\vbox{}}\penalty -\@M}
```

`\twocolumn` There are several bug fixes to the two-column stuff here.

```

\@topnewpage 199 \def \twocolumn {%
200     \clearpage
201     \global\columnwidth\textwidth
202     \global\advance\columnwidth-\columnsep
203     \global\divide\columnwidth\tw@
204     \global\hsize\columnwidth
205     \global\linewidth\columnwidth
206     \global\@twocolumntrue
207     \global\@firstcolumntrue
208     \col@number \tw@

```

There is no reason to put a `\@dblfloatplacement` here since `\@topnewpage` ignores these settings. The `\@floatplacement` is needed in case this comes after some changes.

```

209     \@ifnextchar [\@topnewpage\@floatplacement
210 }

```

Note that here, getting a box from the freelist can assume success since this comes just after a `\clearpage`.

```
211 \long\def \@topnewpage [#1]{%
```

```

212 \@nodoocument
213 \@next\@currbox\@freelist{}{}%
214 \global \setbox\@currbox
215   \color@vbox
216   \normalcolor
217   \vbox {%
218     \hsize\textwidth
219     \@parboxrestore
220     \col@number \@ne
221     #1%
222     \vskip -\dbltextfloatsep
223     }%
224   \color@endbox

```

Added size test and warning message; perhaps we should use an error message.

```

225 \ifdim \ht\@currbox>\textheight
226   \ht\@currbox \textheight
227 \fi

```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from `\@addtodblcol`, plus some extra checks for error trapping.

```

228 \global \count\@currbox \tw@
229 \@tempdima -\ht\@currbox
230 \advance \@tempdima -\dbltextfloatsep
231 \global \advance \@colht \@tempdima
232 \ifx \@dbltoplist \@empty
233 \else
234   \@latexerr{Float(s) lost}\@ehb
235   \let \@dbltoplist \@empty
236 \fi
237 \@cons \@dbltoplist \@currbox

```

This setting of `\@dbltopnum` is used only to change the typesetting in `\@combinedblfloats`.

```

238 \global \@dbltopnum \m@ne
239 \iftrace
240   \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%
241 \ifnotrace

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be `3\baselineskip`, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

242 \ifdim \@colht<2.5\baselineskip
243 \latex@warning@no@line {Optional argument of \noexpand\twocolumn
244 too tall on page \thepage}%
245 \@emptycol
246 \if@firstcolumn
247 \else
248 \@emptycol
249 \fi
250 \else
251 \global \vsize \@colht
252 \global \@colroom \@colht
253 \@floatplacement
254 \fi
255 }

```

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

256 \output {%
257 \let \par \@@par
258 \ifnum \outputpenalty<-\@M
259 \@specialoutput
260 \else
261 \@makecol
262 \@opcol

```

Moved to `\@opcol: \@floatplacement`.

```

263 \@startcolumn

```

This loop could be replaced by an `\expandafter` tail recursion in `\@startcolumn`.

```

264 \@whilesw \if@fcolmade \fi
265 {%
266 (*trace)
267 \fl@trace{PAGE: float \if@twocolumn column \else page \fi
268 completed}%
269 /trace)
270 \@opcol\@startcolumn}%
271 \fi
272 \ifnum \outputpenalty>-\@Miv

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the `vsize` and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\@colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\emptycol` will be executed again when the OR is called by the page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.)

```

273   \ifdim \@colroom<1.5\baselineskip
274     \ifdim \@colroom<\textheight
275       \@latex@warning@no@line {Text page \thepage\space
276         contains only floats}%
277     \emptycol
278 %     \iftwocolumn

290 \else
291   \global \vsize \maxdimen
292 \fi
293 }

```

#### CHANGES TO `\@specialoutput`:

\* `\penalty\z@` changed to `\penalty\interlinepenalty` so `\samepage` works properly with figure and table environments.

(Changed 23 Oct 86)

\* Definition of `\@specialoutput` changed 26 Feb 88 so `\@pageht` and `\@pagedp` aren't changed for a marginal note.

(Change suggested by Chris Rowley.)

```

294 \gdef\@specialoutput{%
295   \ifnum \outputpenalty>-\@Mii
296     \@doclearpage
297   \else
298     \ifnum \outputpenalty<-\@Miii
299       \ifnum \outputpenalty<-\@MMM \deadcycles \z@ \fi
300       \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
301     \else

```

Note that `\boxmaxdepth` should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen

when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \@cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```
302     \global \setbox\@holdpg \vbox{%
303         \unvbox\@holdpg
304         \unvbox\@cclv
```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by T<sub>E</sub>X.

```
305         \setbox\@tempboxa \lastbox
306         \unskip
307     }%
```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```
308     \@pagedp \dp\@holdpg
309     \@pageht \ht\@holdpg
310     \unvbox \@holdpg
311     \@next\@currbox\@currlist{%
312         \ifnum \count\@currbox>\z@
```

Putting the whole size into `\@pageht` (see above).

```
313         \advance \@pageht \@pagedp
314         \ifvoid\footins \else
315             \advance \@pageht \ht\footins
316             \advance \@pageht \skip\footins
317             \advance \@pageht \dp\footins
318         \fi
319         \ifvbox \@kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The \*-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```
320         \ifdim \wd\@kludgeins=\z@
321             \advance \@pageht \ht\@kludgeins
322 (*trace)
323             \fl@trace {Extra size added: \the \ht\@kludgeins}%
324 (/trace)
325         \fi
326     \fi
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
327     \@reinserts
328     \@addtocurcol
329     \else
330     \@reinserts
331     \@addmarginpar
332     \fi
333 }%\@latexbug
```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a `\nobreak` must be correct.

```

334     \ifnum \outputpenalty<\z@
335     \if@nobreak
336     \nobreak
337     \else
338     \addpenalty \interlinepenalty
339     \fi
340     \fi
341     \fi
342     \fi
343 }
344 </2ekernel | fltrace>

```

`\@testwrongwidth` Test if the float box has the wrong width when trying to place it into some area.  
`\f@depth` (Actually the test is for a conventional depth setting rather than for the width of the float. For that reason the box depth was explicitly tailored when the float was created).

```

370 <latexrelease>\EndIncludeInRelease

```

`\@docclearpage` This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test `\@testwrongwidth{<box>}` at suitable places. That is at places where a box is taken off the deferlist.

```

`\@opcol` Several changes in detail here.

```

465 (*2ekernel | fltrace)
466 \def \@opcol {%
467   \if@twocolumn
468     \@outputdblcol
469   \else
470     \@outputpage
471 (*trace)
472   \fl@trace{PAGE: one column (float? see above) page completed}%
473 </trace>

```

Not needed since it comes after `\@outputpage`:

```

474 %   \global\@colht\textheight
475   \fi

```

These do not need to be done every time `\@opcol` is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

476 \global \@mparbottom \z@ \global \@textfloatsheight \z@
477 \@floatplacement
478 }
479 </2ekernel | fltrace>

```

`\@makecol` We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```

480 (*2ekernel)
481 \gdef \@makecol {%
482   \ifvoid\footins
483     \setbox\@outputbox \box\@cclv
484   \else
485     \setbox\@outputbox \vbox {%

```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

486     \boxmaxdepth \@maxdepth
487 %     \@tempdima\dp\@cclv
488     \unvbox \@cclv
489 %     \vskip-\@tempdima
490     \vskip \skip\footins
491     \color@begingroup
492     \normalcolor
493     \footnoterule
494     \unvbox \footins
495     \color@endgroup
496   }%
497   \fi

```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```
498 \let\@elt\relax
499 \xdef\@freelist{\@freelist\@midlist}%

500 \global \let \@midlist \@empty
501 \@combinefloats
```

The variations start here in case `\enlargethispage` has been used.

```
502 \ifvbox\@kludgeins
503 \@makespecialcolbox
504 \else
```

This extra reboxing is only needed to add the `\@texttop` and `\@textbottom` but this could be done earlier, when the floats are added.

The `\boxmaxdepth` resetting here will have no effect unless `\@textbottom` ends with a box or rule. So is this (or possibly `\@maxdepth`) the correct value?

The `\vskip -\dimen@` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens within `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen@`.

```
505 \setbox\@outputbox \vbox to\@colht {%
506 % \boxmaxdepth \maxdepth %??
507 \@texttop
508 \dimen@ \dp\@outputbox
509 \unvbox \@outputbox
510 \vskip -\dimen@
511 \@textbottom
512 }%
513 \fi
514 \global \maxdepth \@maxdepth
515 }
```

`\@reinserts` This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```
516 \gdef \@reinserts{%
517 \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
518 \ifvbox\@kludgeins\insert\@kludgeins
519 \{\unvbox\@kludgeins}\fi
520 }
521 </2ekernel)
```

`\@makespecialcolbox` This implements certain variations in page-makeup.

```
522 (*2ekernel | fltrace)
```

```

523 \gdef \@makespecialcolbox {%
524 (*trace)
525   \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
526             dp \the\dp\@kludgeins\space
527             wd \the\wd\@kludgeins}%
528 </trace>

```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```

529   \setbox\@outputbox \vbox {%
530     \@texttop
531     \dimen@ \dp\@outputbox
532     \unvbox\@outputbox
533     \vskip-\dimen@
534   }%
535   \@tempdima \@colht
536   \ifdim \wd\@kludgeins>\z@

```

Note that in this case (the \*-version), the height of the `\@kludgeins` box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size `\@colht` using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the  $\text{T}_{\text{E}}\text{X}$  level!).

This needs  $\text{T}_{\text{E}}\text{X}3$  otherwise `\pageshrink` is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for bothe flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

Their should perhaps be an upper limit, of `0pt?`, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

537   \advance \@tempdima -\ht\@outputbox
538   \advance \@tempdima \pageshrink

547     \unvbox\@outputbox
548     \vskip \@tempdima
549     \@textbottom
550   }%

```

For the unstarred version, the final size of the page is precisely specified. Therefore,

at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

551   \else
552     \advance \@tempdima -\ht\@kludgeins
553 (*trace)
554   \fl@trace {Natural ht of col: \the \ht\@outputbox}%
555   \fl@trace {\string \@colht: \the \@colht}%
556   \fl@trace {Extra size added: -\the \ht \@kludgeins}%
557   \fl@trace {Hence, height of inner box: \the \@tempdima}%
558   \fl@trace {Max? pageshrink available: \the \pageshrink}%
559 </trace>

```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

560     \setbox \@outputbox \vbox to \@colht {%
561       \vbox to \@tempdima {%
562         \unvbox\@outputbox
563         \@textbottom}%
564       \vss}%
565   \fi

```

Finally we need to explicitly make the insert box void.

```

566   {\setbox \@tempboxa \box \@kludgeins}%
567 (*trace)
568   \fl@trace {kludgeins box made void}%
569 </trace>
570 }
571 </2kernel | fltrace>

```

```

\@texttop These do nothing as a default.
\@textbottom 572 (*2kernel)
573 \let \@texttop \relax
574 \let \@textbottom \relax

```

`\@resetactivechars` RmS 93/09/06: added hook to protect against certain active characters in the output routine. Default checks are for active space and end-of-line.

`\@activechar@info`

```

575 \def\@activechar@info #1{%
576   \@latex@info@no@line {Active #1 character found while
577     output routine is active
578     \MessageBreak
579     This may be a bug in a package file
580     you are using}%
581 }

```

Do not put any spaces in this next bit!

```

582 \begingroup
583 \obeylines\obeyspaces%
584 \catcode'\'\active%
585 \gdef\@resetactivechars{%
586 \def^M{\@activechar@info{EOL}\space}%

```

```

587 \def {\@activechar@info{space}\space}%
588 \let'\active@math@prime}%
589 \endgroup

```

`\@outputpage` The `\color@hbox` hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

`\@shipoutsetup` There has been extensive tidying up of the old code here; including the removal of a level of grouping.

`\@writesetup` The setting of `\protect` immediately before the `\shipout` is needed so that protected commands within `\writes` are handled correctly.

Within `shipout`'s `vbox` it is reset to its default value, `\relax`.

Resetting it to its default value after the `shipout` has been completed (and the contents of the `writes` have been expanded) must be done by use of `\aftergroup`. This is because it must have the value `\relax` before macros coming from other uses of `\aftergroup` within this box are expanded.

Putting this into the `\aftergroup` token list does not affect the definition used in expanding the `\writes` because the `aftergroup` token list is only constructed when popping the `save-stack`, it is not expanded until after the `shipout` is completed.

Question: should things from an `\aftergroup` within the shipped out box be executed in the environment set up for the `writes`, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```

590 </2ekernel>
591 (latexrelease)\IncludeInRelease{2017/04/15}%
592 (latexrelease) {\@outputpage}{Reset language for hyphenation}%
593 (*2ekernel|latexrelease)
594 \def\@outputpage{%

```

The `\endgroup` is put in by `\aftergroup`.

```
595 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the `writes`.

From here ... was in the command `\@writesetup`.

```
596 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a `pagebreak` in `verbatim` does not prevent hyphenation in the page head.

```
597 \language\document@default@language
```

The `\catcode'\ = 10` was removed as it was considered useless (presumably because nothing gets tokenised during `shipout`).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

```
598 \@resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
599 \global\let\@if@newlist\if@newlist
600 \global\@newlistfalse
```

This next hook replaces the following:

```
\let-\@dischyph
\let'\@acci\let'\@accii\let\=\@acciii
\let\\@normalcr
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normallineskip
\baselineskip\normalbaselineskip
\sloppy
```

```
601 \@parboxrestore
```

... to here was in the command `\@writsetup`.

```
602 \shipout \vbox{%
603   \set@typeset@protect
604   \aftergroup \endgroup
```

Correct? or just restore by ending the group?

```
605   \aftergroup \set@typeset@protect
```

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command `\@shipoutsetup`.

```
606 \if@specialpage
607   \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%
608 \fi
609 \if@twoside
610   \ifodd\count\z@ \let\@thehead\@oddhead \let\@thefoot\@oddfoot
611     \let\@themargin\oddsidemargin
612   \else \let\@thehead\@evenhead
613     \let\@thefoot\@evenfoot \let\@themargin\evensidemargin
614   \fi
615 \fi
```

The rest was always inside the box.

RmS 91/08/15: aded this line:

```
616 \reset@font
```

RmS 93/08/06 Added `\lineskiplimit=0pt` to guard against it being nonzero:  
e.g. by `\offinterlineskip` being in effect.

There are probably lots of other things that may need resetting.

```
617 \normalsize
```

Reset the space factors.

```
618 \normalsfcodes
```

Reset these here (previously reset separately for head and foot)

```
619 \let\label@gobble
```

```
620 \let\index@gobble
```

```
621 \let\glossary@gobble
```

```
622 \baselineskip\z@skip \lineskip\z@skip \lineskiplimit\z@
```

... to here was in the command `\@shipoutsetup`.

```
623 \@beginndvi
```

```
624 \vskip \topmargin
```

```
625 \moveright\@themargin \vbox {%
```

```

1147 </trace>

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1148         \if@nobreak
1149             \nobreak
1150             \@nobreakfalse
1151             \everypar{}%
1152         \else
1153             \addpenalty \interlinepenalty
1154         \fi

```

```

1155             \vskip \intextsep
1156             \box\@currbox
1157             \penalty\interlinepenalty
1158             \vskip\intextsep
1159             \ifnum\outputpenalty <-\@Mii \vskip -\parskip\fi

```

Typesetting ends here.

```

1312 <latexrelease | fltrace | flafter>          \the \@colnum}%
1313 </trace>

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1314 <latexrelease | fltrace | flafter>          \if@nobreak
1315 <latexrelease | fltrace | flafter>          \nobreak
1316 <latexrelease | fltrace | flafter>          \@nobreakfalse
1317 <latexrelease | fltrace | flafter>          \everypar{}%
1318 <latexrelease | fltrace | flafter>          \else
1319 <latexrelease | fltrace | flafter>          \addpenalty\interlinepenalty
1320 <latexrelease | fltrace | flafter>          \fi
1321 <latexrelease | fltrace | flafter>          \vskip \intextsep
1322 <latexrelease | fltrace | flafter>          \box\@currbox
1323 <latexrelease | fltrace | flafter>          \penalty\interlinepenalty
1324 <latexrelease | fltrace | flafter>          \vskip\intextsep
1325 <latexrelease | fltrace | flafter>          \ifnum\outputpenalty
1326 <latexrelease | fltrace | flafter>          <-\@Mii \vskip
1327 <latexrelease | fltrace | flafter>          -\parskip\fi

```

Typesetting ends here.

```

1328 <latexrelease | fltrace | flafter>          \outputpenalty \z@
1329 <latexrelease | fltrace | flafter>          \@inserttrue
1330 (*trace)

1337 <latexrelease | fltrace | flafter>          \if@insert
1338 <latexrelease | fltrace | flafter>          \else

```

Next set of docstrip guards are a bit weird, essentially \@addtotoporbot ends up inside the kernel and the fltrace package and \@addtotoporbot shows up in the flafter package. Guess that could have been done a bit more obvious :-)

```

`\@addmarginpar`

```
1811 (*2kernel)
1812 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox
1813   \@cons\@freelist\@currbox}\@latexbug\@tempcnta\@ne
1814   \if@twocolumn
1815     \if@firstcolumn \@tempcnta\m@ne \fi
1816   \else
1817     \if@mparswitch
1818       \ifodd\c@page \else\@tempcnta\m@ne \fi
1819     \fi
1820     \if@reversemargin \@tempcnta -\@tempcnta \fi
1821   \fi
1822   \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1823   \@tempdima\@mparbottom
1824   \advance\@tempdima -\@pageht
1825   \advance\@tempdima\ht\@marbox
1826   \ifdim\@tempdima >\z@
1827     \@latex@warning@no@line {Marginpar on page \thepage\space moved}%
1828   \else
1829     \@tempdima\z@
1830   \fi
1831   \global\@mparbottom\@pageht
1832   \global\advance\@mparbottom\@tempdima
1833   \global\advance\@mparbottom\dp\@marbox
1834   \global\advance\@mparbottom\marginparpush
1835   \advance\@tempdima -\ht\@marbox
```

Putting box movement inside the ‘marbox’:

```
1836   \global\setbox \@marbox
1837     \vbox {\vskip \@tempdima
1838           \box \@marbox}%
1839   \global \ht\@marbox \z@
1840   \global \dp\@marbox \z@
```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```
1841   \kern -\@pagedp
1842   \nointerlineskip
1843   \hb@xt@\columnwidth
1844     {\ifnum \@tempcnta >\z@
1845       \hskip\columnwidth \hskip\marginparsep
1846     \else
1847       \hskip -\marginparsep \hskip -\marginparwidth
1848     \fi
1849     \box\@marbox \hss}%
```

For this reason the following code can vanish:

```
\nobreak           %% No longer needed. CAR92/12
\vskip -\@tempdima %% No longer needed. CAR92/12

1850   \nointerlineskip
1851   \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}
```

### 65.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L<sup>A</sup>T<sub>E</sub>X<sub>2</sub>ε.

```
\enlargethispage{<dim>}
```

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

```
\enlargethispage*{<dim>}
```

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a `\clearpage`: please give keep them clear of such places.

`\@kludgeins` The insert which makes T<sub>E</sub>X do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1852 \newinsert \@kludgeins
1853 \global\dimen\@kludgeins \maxdimen
1854 \global\count\@kludgeins 1000
```

`\enlargethispage` The user command.

```
\enlargethispage* 1855 \gdef \enlargethispage {%
1856   \ifstar
1857   {%
1858   (*trace)
1859     \fl@trace{Enlarging page height * }%
1860   </trace>
1861     \@enlargepage{\hbox{\kern\p@}}%
1862     {%
1863   (*trace)
1864     \fl@trace{Enlarging page height exactly---}%
1865   </trace>
1866     \@enlargepage\@empty}%
1867 }
```

`\@enlargepage` This actually inserts the insert, after checking for extreme values of the change.

```
1868 \gdef \@enlargepage#1#2{%
1869   (*trace)
1870   \fl@trace{\@spaces\@spaces by #2}%
1871 </trace>
1872   \@tempkipa#2\relax
1873   \ifdim \@tempkipa>.5\maxdimen
```

```

1874     \@latexerr{Suggested\space extra\space height\space
1875               (\the\@tempskipa)\space dangerously\space
1876               large}\@eha
1877     \else
1878       \ifdim \vsize<.5\maxdimen
1879 (*trace)
1880       \fl@trace {Kludgeins added--pagegoal before: \the\pagegoal}%
1881 </trace>
1882       \@bsphack
1883       \insert\@kludgeins{#1\vskip-\@tempskipa}%
1884       \@esphack

```

This next bit is for tracing only:

```

1885 (*trace)
1886     \ifvmode \par
1887     \fl@trace {Kludgeins added--pagegoal after: \the\pagegoal}%
1888     \fi
1889 </trace>
1890     \else
1891     \@latexerr{Page\space height\space already\space
1892               too\space large}\@eha
1893     \fi
1894   \fi
1895 }
1896 </2ekernel>

```

### 65.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in L<sup>A</sup>T<sub>E</sub>X<sub>2</sub>ε.

```
\suppressfloats
```

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the followinghg are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\fl@trace Set-up tracing for floats independent of other tracing as it produces mega-output.
\tracefloatsoff Default is no tracing.

```

We need to make sure that `fltrace` comes before `flafter` to make the tracing work.

```

1958 \@ifpackageloaded{flafter}
1959   {\PackageWarningNoLine
1960     {fltrace}{Load 'fltrace' before 'flafter'\MessageBreak
1961       Attempting to recover by reloading 'flafter'}%

```

Hide the fact that `flafter` was already loaded and then request it anew.

```

1962   \expandafter\let\csname ver@flafter.sty\endcsname\relax
1963   \def\reserved@a#1{%
1964     \expandafter\let\csname\string#1+flafter+IIR\endcsname\relax}%
1965   \reserved@a\@addtocurcol
1966   \reserved@a\@addtonextcol
1967   \RequirePackage{flafter}}{}
1968 </fltrace>

```

As the code for `flafter` will contain tracing calls so that it works in conjunction with `fltrace` we need to provide a dummy definition for `\fl@trace` in that package.

```

1969 <{*flafter}
1970 \providecommand\fl@trace[1]{}
1971 </flafter>

```

`\suppressfloats` Float suppression commands: these set the relevant counter globally to zero. Thus `\@flstop` they are overridden for a particular float by an `!` specifier.

```

1972 <{*2ekernel}
1973 \def \suppressfloats {%
1974   \@ifnextchar [%
1975     \@flstop
1976     {\global \@colnum \z@}%
1977 }

```

Maybe this should be a loop over `#1`?

```

1978 \def \@flstop [#1] {%
1979   \if t#1%
1980     \global \@topnum \z@

```

```

1981 \fi
1982 \if b#1%
1983 \global \@botnum \z@
1984 \fi
1985 }

```

Manipulation of float placement and type; both their strings and the corresponding count registers.

`\@fpstype` First a new count register to go with `\@currtype`.  
`\@reqcolroom` Then a new skip register, for information needed to remove the `\@maxsep` conservatism: it is possible that this could use a temporary register.

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of `\@addtocurcol` which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

1986 \newcount \@fpstype
1987 \newdimen \@reqcolroom
1988 \newdimen \@textfloatsheight
1989 \endkernel

```

`\@fpsadddefault` Adds the default placement to what is already there.  
Should not need to change this, but could do it as follows:

```

\def \@fpsadddefault {%
  \@temptokena \expandafter\expandafter\expandafter
    {\csname fps@\@capttype \endcsname}%
  \edef \reserved@a {\the\@temptokena}%
  \@onelevel@sanitize \reserved@a
  \edef \@fps {\@fps\reserved@a}%
}

```

```

1990 \endkernel | fltrace)
1991 \def \@fpsadddefault {%
1992 \trace)
1993 \fl@trace{fps changed from: \@fps}%
1994 \endtrace)
1995 \edef \@fps {\@fps\csname fps@\@capttype \endcsname}%
1996 \latex@warning {%
1997 No positions in optional float specifier.\MessageBreak
1998 Default added (so using '\@fps')}%
1999 }

```

`\@setfloattypecounts` Sets counters `\@fpstype` and `\@currtype`.  
 $\text{BANG} == \text{bit4 of } \backslash\text{count}\backslash\text{currbox} = 0.$

```

2000 \def \@setfloattypecounts {%
2001 \currtype \count\currbox
2002 \fpstype \count\currbox
2003 \divide\currtype\@xxxii \multiply\currtype\@xxxii

`\@testfp` New definition of the float page test.

```

2037 \def \@testfp #1{%
2038   \@boxfpsbit #18\relax % Really ‘#1 8’ for human readers!
2039   \ifodd \@tempcnta
2040   \else
2041     \@testtrue
2042   \fi
2043 }

```

`\@setfpsbit` Sets required bit of `\@tempcnta` (to 1).

```

2044 \def \@setfpsbit #1{%
2045   \@tempcntb \@tempcnta
2046   \divide \@tempcntb #1\relax
2047   \ifodd \@tempcntb
2048   \else
2049     \advance \@tempcnta #1\relax
2050   \fi

```

```

2051 }
2052 </2ekernel)

```

`\@resethfps` Globally adds `t` as a possible location for an `h` or `!h` only placement: this must be done using the count.

Although it will leave `\@fpstype` set to 17 even if it was originally 1, this does not matter since it is the last thing in `\@addtocurcol`.

```

2053 (*2ekernel | fltrace)
2054 \def \@resethfps {%
2055   \let\reserved@a\@empty
2056   \ifnum \@fpstype=\@ne
2057     \def \reserved@a {!}%
2058     \@fpstype 17
2059   \fi
2060   \ifnum \@fpstype=17
2061     \global \advance \count\@currbox \tw@
2062     \@latex@warning@no@line {%
2063       ‘\reserved@a h’ float specifier changed to ‘\reserved@a ht’}%
2064 (*trace)
2065   \fl@trace{%
2066     ‘t’ added to ‘\reserved@a h’- new Count: \the \count\@currbox}%
2067 </trace)
2068   \fi
2069 }

```

Special stuff for BANG floats.

`\@flsetnum` Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within `\@addtocurcol` because it is used only once within a call of the output routine (which forms a group).

For `\@addtonextcol` this is achieved by putting a group around its code; this is needed because it is called (by `\@startcolumn`) for each float which was on the deferlist. Almost identical considerations pertain to `\@addtodblcol`. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

2070 \def \@flsetnum #1{%
2071 (*trace)
2072   \fl@trace{fpstype: \the \@fpstype (flsetnum \string#1)}%
2073 </trace)
2074   \ifnum \@fpstype<\sist@n
2075     \ifnum #1=\z@
2076 (*trace)
2077     \fl@trace{BANG float resetting \string#1 to 1}%
2078 </trace)
2079     #1\@ne
2080   \fi
2081 \fi
2082 (*trace)
2083   \fl@trace{#1 (before) = \the #1}%
2084 </trace)

```

2085 }

`\@flsettextmin` This ignores `\textfraction` space restriction in case BANG.

```
2086 \def \@flsettextmin {%
2087 (*trace)
2088   \fl@trace{fpstype: \the \@fpstype (flsettextmin)}%
2089 </trace>
2090   \ifnum \@fpstype<\sift@n
2091 (*trace)
2092     \fl@trace{BANG ignoring textmin}%
2093 </trace>
2094     \@textmin \z@
2095   \else
2096     \@textmin \textfraction\colht
2097 (*trace)
2098     \fl@trace{ORD textmin = \the \@textmin}%
2099 </trace>
2100   \fi
2101 }
```

`\@flcheckspace` This ignores space restriction in case BANG; this is still slightly conservative since it does not allow for the fact that, if there is no text in the column then `\textfloatsep` is not needed. Sets `@tempwa` true if there is room for `\@currbox`.

```
2102 \def \@flcheckspace #1#2{%
2103   \advance \@reqcolroom
2104   \ifx #2\empty \textfloatsep \else \floatsep \fi

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn` floatplacement was wrong: `dbl` not needed, `ord` needed.
3. `\floatplacement` was not called after `\startdblcol` or `\topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just `h` and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just `h` or `!h` should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.

7. After an h float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive h floats are separated by twice `\intertextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@docclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The ! option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:  
`\twocolumn[\maketitle more text]`  
 One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user’s viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?

17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-\* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the `vskip` to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.  
  
It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the `vskip` adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.  
  
It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
% Why is this done first?
\global \@mparbottom \z@
\if@twocolumn
\@outputdblcol
\else
\@outputpage
% This is not needed since it is done at the end of
% |\@outputpage|:
\global \@colht \textheight
\fi}
```

Only tracing has been added to these.

```
2160 <latexrelease | fltrace>\IncludeInRelease{2017/01/01}%
2161 <latexrelease | fltrace> {\@makefcolumn}{negative height floats}%
2162 <*2ekernel | fltrace | latexrelease>
2163 \def\@makefcolumn #1{%
2164 \begingroup
```

```

2165 \@fpmin -\maxdimen
2166 \let \@testfp \@gobble
2167 \@tryfcolumn #1%
2168 \endgroup
2169 (*trace)

2193 </trace>
2194 <latexrelease | fltrace>}
2195 <latexrelease | fltrace>\EndIncludeInRelease
2196 </2ekernel | fltrace | latexrelease>

```

This will line up the last baselines in the two columns provided they are constructed in the normal way: i.e. ending in a skip of minus the original depth, with `\@textbottom` adding nothing.

Thus again it is essential for `\@textbottom` to have depth 0pt.

```

2197 <latexrelease | fltrace>\IncludeInRelease{2015/01/01}%
2198 <latexrelease | fltrace> {\@outputdblcol}{2 column marks}%
2199 (*2ekernel | fltrace | latexrelease)

```

This is just a change to the single command `\@outputdblcol` so that it saves mark information for the first column and restores it in the second column.

```

2200 \def\@outputdblcol{%
2201 \if@firstcolumn
2202 \global\@firstcolumnfalse

Save the left column

2203 \global\setbox\@leftcolumn\copy\@outputbox
2204 <fltrace> \fl@trace{PAGE: first column boxed}%

```

Remember the marks from the first column

```

2205 \splitmaxdepth\maxdimen
2206 \vbadness\maxdimen

```

In case of `\enlargethispage` we will have infinite negative glue at the bottom of the page (coming from `\vss`) and that will earn us an error message if we `\vsplit` to get at the marks. So we need to remove the last glue (if any) at the end of `\@outputbox` as we are only interested in marks that change doesn't matter.

```
2207     \setbox\@outputbox\vbox{\unvbox\@outputbox\unskip}%
2208     \setbox\@outputbox\vsplit\@outputbox to\maxdimen
```

One minor difference from the current `fixmarks` package, pass the marks through a token register to stop any `#` tokens causing an error in a `\def`.

```
2209     \toks@\expandafter{\topmark}%
2210     \xdef\@firstcoltopmark{\the\toks@}%
2211     \toks@\expandafter{\splitfirstmark}%
2212     \xdef\@firstcolfirstmark{\the\toks@}%
```

This test does not work if truly empty marks have been inserted, but  $\LaTeX$  marks should always have (at least) two brace groups. (Except before the first mark is used, when the marks are empty, but that is OK here.)

```
2213     \ifx\@firstcolfirstmark\@empty
2214         \global\let\@setmarks\relax
2215     \else
2216         \gdef\@setmarks{%
2217             \let\firstmark\@firstcolfirstmark
2218             \let\topmark\@firstcoltopmark}%
2219     \fi
```

End of change

```
2220 \else
2221     \global\@firstcolumntrue

### 65.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It

also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

### Limits for the placement of floating objects

- `\c@topnumber` This counter holds the maximum number of floats that can appear at the top of a text page or column.  
2288 (\*2ekernel)  
2289 `\newcount\c@topnumber`  
2290 `\setcounter{topnumber}{2}`
- `\topfraction` This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.  
2291 `\newcommand\topfraction{.7}`
- `\c@bottomnumber` This counter holds the maximum number of floats that can appear at the bottom of a text page or column.  
2292 `\newcount\c@bottomnumber`  
2293 `\setcounter{bottomnumber}{1}`
- `\bottomfraction` This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.  
2294 `\newcommand\bottomfraction{.3}`
- `\c@totalnumber` This counter holds the maximum number of floats that can appear on any text page or column.  
2295 `\newcount\c@totalnumber`  
2296 `\setcounter{totalnumber}{3}`
- `\textfraction` This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.  
2297 `\newcommand\textfraction{.2}`
- `\floatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.  
2298 `\newcommand\floatpagefraction{.5}`
- `\c@dbltopnumber` This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.  
2299 `\newcount\c@dbltopnumber`  
2300 `\setcounter{dbltopnumber}{2}`
- `\dbltopfraction` This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.  
2301 `\newcommand\dbltopfraction{.7}`
- `\dblfloatpagefraction` This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.  
2302 `\newcommand\dblfloatpagefraction{.5}`

## Floats on a text page

`\floatsep`  
`\textfloatsep`  
`\intextsep` When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

`\floatsep` is the space between adjacent floats that are placed at the top or bottom of the text page or column.

`\textfloatsep` is the space between the main text and floats at the top or bottom of the page or column.

`\intextsep` is the space between in-text floats and the text.

```
2303 \newskip\floatsep
```

```
2304 \newskip\textfloatsep
```

```
2305 \newskip\intextsep
```

```
2306 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

```
2307 \setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
```

```
2308 \setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

`\dblfloatsep`  
`\dbltextfloatsep` When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

```
2309 \newskip\dblfloatsep
```

```
2310 \newskip\dbltextfloatsep
```

```
2311 \setlength\dblfloatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

```
2312 \setlength\dbltextfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
```

## Floats on their own page or column

`\@fptop`  
`\@fpsep`  
`\@fpbot` When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus ...fil` so as to fill the remaining empty space.

```
2313 \newskip\@fptop
```

```
2314 \newskip\@fpsep
```

```
2315 \newskip\@fpbot
```

```
2316 \setlength\@fptop{0\p@ \@plus 1fil}
```

```
2317 \setlength\@fpsep{8\p@ \@plus 2fil}
```

```
2318 \setlength\@fpbot{0\p@ \@plus 1fil}
```

`\@dblftop`  
`\@dblfpsep`  
`\@dblfpbot` Double-column ‘float pages’ in two-column mode use similar parameters.

```
2319 \newskip\@dblftop
2320 \newskip\@dblfpsep
2321 \newskip\@dblfpbot
2322 \setlength\@dblftop{0\p@ \@plus 1fil}
2323 \setlength\@dblfpsep{8\p@ \@plus 2fil}
2324 \setlength\@dblfpbot{0\p@ \@plus 1fil}
```

**\topfigrule** The macros can be used to put in rules between floats and text; whatever they  
**\botfigrule** insert should be vertical mode material which takes up zero space.

```
\dblfigrule 2325 \let\topfigrule=\relax
2326 \let\botfigrule=\relax
2327 \let\dblfigrule=\relax
2328 </2ekernel>
```

# File L

## ltxclass.dtx

### 66 Introduction

This file implements the following declarations, which replace `\documentstyle` in  $\text{\LaTeX} 2_{\epsilon}$  documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between  $\text{\LaTeX} 2_{\epsilon}$  and  $\text{\LaTeX} 2.09$  is that  $\text{\LaTeX} 2_{\epsilon}$  packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

### 67 User interface

```
\documentclass[<main-option-list>]{<class>}[<version>]
```

There must be exactly one such declaration, and it must come first. The *<main-option-list>* is a list of options which can modify the formatting of elements which are defined in the *<class>* file as well as in all following `\usepackage` declarations (see below). The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

```
\documentstyle[<main-option-list>]{<class>}[<version>]
```

The `\documentstyle` declaration is kept in order to maintain upward compatibility with  $\text{\LaTeX} 2.09$  documents. It is similar to `\documentclass`, but it causes all options in *<main-option-list>* that the *<class>* does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in  $\text{\LaTeX} 2.09$  compatibility mode. As far as most packages are concerned, this only affects the warnings and errors  $\text{\LaTeX}$  generates. This flag does affect the definition of font commands, and `\sloppy`.

```
\usepackage[<package-option-list>]{<package-list>}[<version>]
```

There can be any number of these declarations. All packages in *<package-list>* are called with the same options.

Each *<package>* file defines new elements (or modifies those defined in the *<class>*), and thus extends the range of documents which can be processed. The *<package-option-list>* is a list of options which can modify the formatting of elements defined in the *<package>* file. The *<version>* is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the  $\langle package-option-list \rangle$ , each package processes the  $\langle main-option-list \rangle$ . This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

`filecontents`

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment is allowed only before `\documentclass` to ensure that all packages or options necessary for this particular run are present when needed. The begin and end tags should each be on a line by itself. There is also a star-form; this does not write extra comments into the file.

## 67.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

## 68 Class and Package interface

### 68.1 Class name and version

`\ProvidesClass`

A class can identify itself with the `\ProvidesClass{\langle name \rangle}[\langle version \rangle]` command. The  $\langle version \rangle$  should begin with a date in the format `YYYY/MM/DD`.

## 68.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{⟨name⟩}[⟨version⟩]` command. The `⟨version⟩` should begin with a date in the format YYYY/MM/DD.

## 68.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[⟨options⟩]{⟨name⟩}[⟨version⟩]`. If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.

`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{⟨options⟩}{⟨package⟩}`.

`\PassOptionsToClass` This adds the `⟨options⟩` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
\RequirePackage[baz]{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{⟨name⟩}[⟨version⟩]:`

This is similar to `\LoadClass`, but it always calls class `⟨name⟩` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`.

`\RequirePackageWithOptions` `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

|                                |                                                                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>\@ifpackageloaded</code> | To find out if a package has already been loaded, use                                                                            |
| <code>\@ifclassloaded</code>   | <code>\@ifpackageloaded{&lt;package&gt;}{&lt;true&gt;}{&lt;false&gt;}</code> .                                                   |
| <code>\@ifpackagelater</code>  | To find out if a package has already been loaded with a version equal to or more recent than <code>&lt;version&gt;</code> , use  |
| <code>\@ifclasslater</code>    | <code>\@ifpackagelater{&lt;package&gt;}{&lt;version&gt;}{&lt;true&gt;}{&lt;false&gt;}</code> .                                   |
| <code>\@ifpackagewith</code>   | To find out if a package has already been loaded with at least the options                                                       |
| <code>\@ifclasswith</code>     | <code>&lt;options&gt;</code> , use <code>\@ifpackagewith{&lt;package&gt;}{&lt;options&gt;}{&lt;true&gt;}{&lt;false&gt;}</code> . |

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

## 68.4 Declaring new options

Options for classes and packages are built using the same macros.

|                              |                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\DeclareOption</code>  | To define a builtin option, use <code>\DeclareOption{&lt;name&gt;}{&lt;code&gt;}</code> .                                                |
| <code>\DeclareOption*</code> | To define the default action to perform for local options which have not been declared, use <code>\DeclareOption*{&lt;code&gt;}</code> . |

*Note:* there should be no use of

`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.

Possible uses for `\DeclareOption*` include:

`\DeclareOption*{}`

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

`\DeclareOption*{\@unknownoptionerror}`

Complain about unknown local options. (The initial setting for package files.)

`\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}`

Handle the the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building ‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

`\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%  
{}%  
\OptionNotUsed}}`

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

## 68.5 Safe Input Macros

|                                 |                                                                                                                                                                                                                                                   |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\InputIfFileExists</code> | <code>\InputIfFileExists{&lt;file&gt;}{&lt;then&gt;}{&lt;else&gt;}</code><br>Inputs <code>&lt;file&gt;</code> if it exists. Immediately before the input, <code>&lt;then&gt;</code> is executed. Otherwise <code>&lt;else&gt;</code> is executed. |
| <code>\IfFileExists</code>      | As above, but does not input the file.<br>One thing you might like to put in the <code>&lt;else&gt;</code> clause is                                                                                                                              |

`\@missingfileerror` This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering x quits the current run,

`\input` This has been redefined from the L<sup>A</sup>T<sub>E</sub>X2.09 definition, in terms of the new commands `\InputIfFileExists` and `\@missingfileerror`.

`\listfiles` Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to `\ProvidesPackage` are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

## 69 Implementation

```

1 (*2kernel)
\ifcompatibility The flag for compatibility mode.
2 \newif\ifcompatibility
\@documentclasshook The hook called after the first \documentclass command. By default this checks
to see if \@normalsize is undefined, and if so, sets it to \normalsize.
3 \def\@documentclasshook{%
4   \ifx\@normalsize\undefined
5     \let\@normalsize\normalsize
6   \fi
7 }
\@declaredoptions This list is automatically built by \DeclareOption. It is the list of options (separated
by commas) declared in the class or package file and it defines the order
in which the the corresponding \ds@(<option>) commands are executed. All local
<option>s which are not declared will be processed in the order defined by the
optional argument of \documentclass or \usepackage.
8 \let\@declaredoptions\@empty
\@classoptionslist List of options of the main class.
9 \let\@classoptionslist\relax
10 \@onlypreamble\@classoptionslist
\@unusedoptionlist List of options of the main class that haven't been declared or loaded as class
option files.
11 \let\@unusedoptionlist\@empty
12 \@onlypreamble\@unusedoptionlist
\CurrentOption Name of current package or option.
13 \let\CurrentOption\@empty
\@currname Name of current package or option.
14 \let\@currname\@empty
\@current The current file extension.
15 \global\let\@current=\@empty

```

```

\@clsextension The two possible values of \@currentt.
\@pkgextension 16 \def\@clsextension{cls}
                17 \def\@pkgextension{sty}
                18 \@onlypreamble\@clsextension
                19 \@onlypreamble\@pkgextension

\@pushfilename Commands to push and pop the file name and extension.
\@popfilename  #1 current name.
\@currnamestack #2 current extension.
                #3 current catcode of @.
                #4 Rest of the stack.
                20 \def\@pushfilename{%
                21   \xdef\@currnamestack{%
                22     {\@currname}%
                23     {\@currentt}%
                24     {\the\catcode'\@}%
                25     \@currnamestack}}
                26 \@onlypreamble\@pushfilename
                27 \def\@popfilename{\expandafter\@p@pfilename\@currnamestack\@nil}
                28 \@onlypreamble\@popfilename
                29 \def\@p@pfilename#1#2#3#4\@nil{%
                30   \gdef\@currname{#1}%
                31   \gdef\@currentt{#2}%
                32   \catcode'\@#3\relax
                33   \gdef\@currnamestack{#4}}
                34 \@onlypreamble\@p@pfilename
                35 \gdef\@currnamestack{}
                36 \@onlypreamble\@currnamestack

\@optionlist Returns the option list of the file.
                37 \def\@optionlist#1{%
                38   \@ifundefined{opt@#1}\@empty{\csname opt@#1\endcsname}}
                39 \@onlypreamble\@optionlist

\@ifpackageloaded \@ifpackageloaded{<name>} Checks to see whether a file has been loaded.
\@ifclassloaded  40 \def\@ifpackageloaded{\@ifl@aded\@pkgextension}
                  41 \def\@ifclassloaded{\@ifl@aded\@clsextension}
                  42 \@onlypreamble\@ifpackageloaded
                  43 \@onlypreamble\@ifclassloaded
                  44 \def\@ifl@aded#1#2{%
                  45   \expandafter\ifx\csname ver@#2.#1\endcsname\relax

`\default@ds` The default default option code. Set by `\@onefilewithoptions` to either `\OptionNotUsed` for classes, or `\@unknownoptionerror` for packages. This may be reset in either case with `\DeclareOption*`.

```

201 % \let\default@ds\OptionNotUsed

```

`\ProcessOptions` `\ProcessOptions` calls `\ds@option` for each known package option, then calls `\default@ds` for each option on the local options list. Finally resets all the declared options to `\relax`. The empty option does nothing, this has to be reset on the off chance it's set to `\relax` if an empty element gets into the `\@declaredoptions` list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of `@`.

For classes, we can immediately process the file. For other types, `#2` could be a comma separated list, so loop through, processing each one separately.

## 70 Package/class rollback mechanism

```

635 </2kernel>
636 <*2kernel | latexreleasefirst>

```

`\pkgcls@debug` For testing we have a few extra lines of code that by default do nothing but one can set `\pkgcls@debug` to `\typeout` to get extra info. Sometime in the future this will be dropped.

```

637 <*tracerollback>
638 %\let\pkgcls@debug\typeout
639 \let\pkgcls@debug\@gobble
640 </tracerollback>

```

`\requestedLaTeXdate` The macro (!) `\requestedLaTeXdate` holds the globally requested rollback date (via `latexrelease`) or zero if no such request was made.

```

641 \def\requestedLaTeXdate{0}

```

`\pkgcls@targetdate` `\pkgcls@targetlabel` `\pkgcls@innerdate` If a rollback for a package or class is requested then `\pkgcls@targetdate` holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of `\requestedLaTeXdate`) and `\pkgcls@targetlabel` will be empty. If there was a request for a named version then `\pkgcls@targetlabel` holds the version name and `\pkgcls@targetdate` is set to 1.

`\pkgcls@targetdate=0` is used to indicate that there was no rollback request. While loading an old release `\pkgcls@targetdate` is also reset to zero so that `\DeclareRelease` declarations are bypassed.

In contrast `\pkgcls@innerdate` will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain T<sub>E</sub>X largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```

642 \ifx\pkgcls@targetdate\@undefined
643 \newcount\pkgcls@targetdate
644 \fi
645 \let\pkgcls@targetlabel\@empty

```

```

646 \def\pkgcls@innerdate{\maxdimen}

\pkgcls@candidate When looping through the \DeclareRelease declarations we record if the release
\pkgcls@releasedate is the best candidate we have seen so far. This is recorded in \pkgcls@candidate
and we update it whenever we see a better one.
    In \pkgcls@releasedate we keep track of the release date of that candidate.
647 \let\pkgcls@candidate\@empty
648 \let\pkgcls@releasedate\@empty

\load@onefilewithoptions the best place to add the rollback code is at the point where \@onefilewithoptions
\@onefilewithoptions is called to load a single class or package.
    To make things easy we save the old definition as \load@onefilewithoptions
and then provide a new interface.
    Important: as this code is also unconditionally placed into latexrelease we can
only do this name change once otherwise both macros will contain the same code.
649 \ifx\load@onefilewithoptions\undefined
650 \let\load@onefilewithoptions\@onefilewithoptions
651 \def\@onefilewithoptions#1[#2][#3]#4{%
First a bit of tracing normally disabled.
652 (*traceroollback)
653 \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
654 \pkgcls@debug{\@spaces 1: #1}%
655 \pkgcls@debug{\@spaces 2: #2}%
656 \pkgcls@debug{\@spaces 3: #3}%
657 \pkgcls@debug{\@spaces 4: #4}%
658 </traceroollback)
Two of the arguments are needed later on in error/warning messages so we save
them.
659 \def\pkgcls@name{#1}%           % for info message
660 \def\pkgcls@arg {#3}%           % for info message
then we parse the final optional argument to determine if there is a spe-
cific rollback request for the current file. This will set \pkgcls@targetdate,
\pkgcls@targetlabel and \pkgcls@mindate.
661 \pkgcls@parse@date@arg{#3}%
When determining the correct release to load we keep track of candiates in
\pkgcls@candidate and initially we don't have any:
662 \let\pkgcls@candidate\@empty
If we had a rollback request then #3 may contain data but not necessarily a “min-
imal date” so instead of passing it on we pass on the content of \pkgcls@mindate.
We need to pass the value not the command, otherwise nested packages may pick
up the wrong information.
663 \begingroup
664 \edef\reserved@a{%
665 \endgroup
666 \unexpanded{\load@onefilewithoptions#1[#2]}%
667 [\pkgcls@mindate]%
668 \unexpanded{#4}}%
669 \reserved@a
670 }
671 \fi

```

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at that date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn’t start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

| Input                         | <code>\pkgcls@targetdate</code>                    | <code>\pkgcls@targetlabel</code> | <code>\pkgcls@mindate</code> |
|-------------------------------|----------------------------------------------------|----------------------------------|------------------------------|
| <code>&lt;empty&gt;</code>    | <code>&lt;global-rollbackdate-as-number&gt;</code> | <code>&lt;empty&gt;</code>       | <code>&lt;empty&gt;</code>   |
| <code>&lt;date&gt;</code>     | <code>&lt;global-rollbackdate-as-number&gt;</code> | <code>&lt;empty&gt;</code>       | <code>&lt;date&gt;</code>    |
| <code>=&lt;date&gt;</code>    | <code>&lt;date-as-number&gt;</code>                | <code>&lt;empty&gt;</code>       | <code>&lt;empty&gt;</code>   |
| <code>=&lt;version&gt;</code> | <code>1</code>                                     | <code>&lt;version&gt;</code>     | <code>&lt;empty&gt;</code>   |
| <code>&lt;other&gt;</code>    | <code>&lt;global-rollbackdate-as-number&gt;</code> | <code>&lt;empty&gt;</code>       | <code>&lt;other&gt;</code>   |

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn’t one 0.

```
672 \def\pkgcls@parse@date@arg #1{%
```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```
673   \ifx\@nil#1\@nil
674     \pkgcls@targetdate\requestedLaTeXdate\relax
675     \let\pkgcls@targetlabel\@empty
676     \let\pkgcls@mindate\@empty
```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
677   \else
678     \pkgcls@parse@date@arg#1=\@nil\relax
679   \fi
680 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@:`

```
681 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
682   \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
683 \ifx\@nil#1\@nil
684 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```
685 \ifnum \pkgcls@targetdate=\z@
686 \pkgcls@targetdate\@ne
687 \def\pkgcls@innerdate{\maxdimen}%
688 \pkgcls@parse@date@arg@version#2%
689 \else
690 \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
691 \fi
692 \let\pkgcls@mindate\@empty
693 \else
```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of `\pkgcls@targetdate`):

```
694 \requestedLaTeXdate\relax
695 \let\pkgcls@targetlabel\@empty
696 \def\pkgcls@innerdate{\maxdimen}%
697 \def\pkgcls@mindate{#1}%
```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```
698 \ifnum \pkgcls@targetdate > \z@
699 \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
700 \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
701 A minimal date of #1 has been specified for
702 \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
703 But this is in conflict
704 with a rollback request to \requestedpatchdate}
705 \fi
706 \fi
707 \fi
708 }
```

Strip off the trailing = and assign the version name to `\pkgcls@targetlabel`.

```
709 \def\pkgcls@parse@date@arg@version#1={%
710 \def\pkgcls@targetlabel{#1}}
```

`\DeclareRelease` First argument is the "name" of the release and it can be left empty if one doesn't like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should

be  $\langle pkg/cls-name \rangle - \langle date \rangle . \langle extension \rangle$  but this is not enforced and through this argument one can overwrite it.

```

711 \def\DeclareRelease#1#2#3{%
712   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
713   (*traceroollback)
714   \pkgcls@debug{---\string\DeclareRelease:}%
715   \pkgcls@debug{\@spaces 1: #1}%
716   \pkgcls@debug{\@spaces 2: #2}%
717   \pkgcls@debug{\@spaces 3: #3}%
718   /traceroollback)

```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

719   \ifx\@nil#2\@nil
720     \ifnum\pkgcls@targetdate=\@ne % named request
721     \def\reserved@a{#1}%
722     \ifx\pkgcls@targetlabel\reserved@a
723     \pkgcls@use@this@release{#3}{}%
724   (*traceroollback)
725     \else
726     \pkgcls@debug{Label doesn't match}%
727   /traceroollback)
728   \fi
729 (*traceroollback)
730   \else
731   \pkgcls@debug{Date request: ignored}%
732 /traceroollback)
733   \fi
734   \else

```

If the value of  $\backslash\text{pkgcls@targetdate}$  is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```

735   \ifnum\pkgcls@targetdate>\@ne % a real request

```

So we parse the date of this release to check if it is before or after the request date.

```

736   \ifnum\@parse@version#2//00\@nil
737   >\pkgcls@targetdate

```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn't one (i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exists. So we make a complained to the user.

```

738   \ifx\pkgcls@candidate\@empty
739   \pkgcls@rollbackdate@error{#2}%
740   \pkgcls@use@this@release{#3}{#2}%
741   \else
742   \pkgcls@use@this@release\pkgcls@candidate
743   \pkgcls@releasedate
744   \fi
745   \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

746         \def\pkgcls@candidate{#3}%
747         \def\pkgcls@releasedate{#2}%
748 (*traceroollback)
749         \pkgcls@debug{New candidate: #3}%
750 </traceroollback)
751         \fi
752     \else

```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

753         \def\reserved@a{#1}%
754         \ifx\pkgcls@targetlabel\reserved@a
755             \pkgcls@use@this@release{#3}{#2}%
756 (*traceroollback)
757         \else
758             \pkgcls@debug{Label doesn't match}%
759 </traceroollback)
760         \fi
761     \fi
762 \fi
763 \fi
764 }

```

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```
765 \def\pkgcls@use@this@release#1#2{%
```

Before that we record the selection made inside the transcript.

```
766 \pkgcls@show@selection{#1}{#2}%
```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed<sup>9</sup> and then we finally load the correct release.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `\@@input!`

```

767 \pkgcls@targetdate\z@
768 \@@input #1\relax
769 \endinput
770 }

```

`\pkgcls@show@selection` This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for

<sup>9</sup>The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```

771 \def\pkgcls@show@selection#1#2{%
772 (*traceroollback)
773 \pkgcls@debug{Result: use #1}%
774 </traceroollback)
775 \GenericInfo
776 {\@spaces\@spaces\space}{Rollback for
777 \@cls@pkg\space'\@currname' requested ->
778 \ifnum\pkgcls@targetdate>\@ne
779 date
780 \ifnum\requestedLaTeXdate=\pkgcls@targetdate
781 \requestedpatchdate
782 \else
783 \expandafter\@gobble\pkgcls@arg
784 \fi.\MessageBreak

```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```

785 Best approximation is
786 \else
787 version '\pkgcls@targetlabel'.\MessageBreak
788 This corresponds to
789 \fi
790 \ifx\@nil#2\@nil
791 a special release%
792 \else
793 the release introduced on #2%
794 \fi
795 \@gobble}%
796 }

```

`\pkgcls@rollbackdate@error` This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```

797 \def\pkgcls@rollbackdate@error#1{%
798 \latex@error{Suspicious rollback date given}%
799 {The \@cls@pkg\space'\@currname' claims that it
800 came into existence on #1 which\MessageBreak
801 is after your requested rollback date --- so
802 something is wrong here.\MessageBreak
803 Continue and we use the earliest known release.}}

```

`\DeclareCurrentRelease` This declares the date (and possible name) of the current version of a package or class.

```

804 \def\DeclareCurrentRelease#1#2{%

```

First we test if `\pkgcls@targetdate` is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```

805 \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
806 (*traceroollback)

```

```

807 \pkgcls@debug{---DeclareCurrentRelease}%
808 \pkgcls@debug{ 1: #1}%
809 \pkgcls@debug{ 2: #2}%
810 </tracerollback>

```

If the value is greater than 1 we have to deal with a date request, so we parse #2 as a date and compare it with \pkgcls@targetdate.

```

811 \ifnum\pkgcls@targetdate>\@ne % a date request
812 \ifnum\@parse@version#2//00\@nil
813 >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a \DeclareCurrentRelease but no declared older releases (so basically the use of the declaration is a bit dubious).

```

814
815 \ifx\pkgcls@candidate\@empty
816 \pkgcls@rollbackdate@error{#2}%
817 \else
818 \pkgcls@use@this@release\pkgcls@candidate
819 \pkgcls@releasedate
820 \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

821 \else
822 \pkgcls@show@selection{current version}{#2}%
823 \fi
824 \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

825 \def\reserved@a{#1}%
826 \ifx\pkgcls@targetlabel\reserved@a
827 \pkgcls@show@selection{current version}{#2}%
828 \else
829 \@latex@error{Requested version '\pkgcls@targetlabel' for
830 \cls@pkg\space'\@currname' is unknown}\@ehc
831 \fi
832 \fi
833 \fi
834 }

```

**\IfTargetDateBefore** This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

835 \long\def\IfTargetDateBefore#1{%
836 \ifnum\pkgcls@innerdate <%
837 \expandafter\@parse@version\expandafter0#1//00\@nil

```

```

838     \typeout{Exclude code introduced on #1}%
839     \expandafter\@firstoftwo
840   \else
841     \typeout{Include code introduced on #1}%
842     \expandafter\@secondoftwo
843   \fi
844 }

845 </2ekernel | latexreleasefirst>

```

## 71 After Preamble

Finally we declare a package that allows all the commands declared above to be `\@onlypreamble` to be used after `\begin{document}`.

```

846 <*afterpreamble>
847 \NeedsTeXFormat{LaTeX2e}
848 \ProvidesPackage{pkgindoc}
849     [1994/10/20 v1.1 Package Interface in Document (DPC)]
850 \def\reserved@a#1\do\@classoptionslist#2\do\filecontents#3\relax{%
851   \gdef\@preamblecmds{#1#3}}
852 \expandafter\reserved@a\@preamblecmds\relax
853 </afterpreamble>

```

## File M

# lthyphen.dtx

This file contains the code for loading hyphenation patterns into L<sup>A</sup>T<sub>E</sub>X. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L<sup>A</sup>T<sub>E</sub>X system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 </driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T<sub>E</sub>X's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 (*default)
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}%
10    \language=0
11    \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking `\@@end` (which is the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> name for T<sub>E</sub>X's `\end` primitive).

```
12   {\errhelp{The configuration for hyphenation is incorrectly
13             installed.^^J}%
14             If you don't understand this error message you need
15             to seek^^Jexpert advice.}%
16   \errmessage{OOPS! I can't find any hyphenation patterns for
17             US english.^^J \space Think of getting some or the
18             latex2e setup will never succeed}\@@end}
19 </default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
\language=0
\input hyphen % (or \input ushyphen1 if the file has been renamed)
```

```
\language=1
\input ghyph31
\language=0
\lefthyphenmin=2
\rightthyphenmin=3
\endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

# File N

## l<sub>t</sub>luatex.dtx

### 72 Overview

Lua<sub>T</sub><sub>E</sub>X adds a number of engine-specific functions to <sub>T</sub><sub>E</sub>X. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for Lua<sub>T</sub><sub>E</sub>X at the L<sup>A</sup><sub>T</sub><sub>E</sub>X 2<sub>ε</sub> kernel level plus as a loadable file which can be used with plain <sub>T</sub><sub>E</sub>X and L<sup>A</sup><sub>T</sub><sub>E</sub>X.

This file contains code for both <sub>T</sub><sub>E</sub>X (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following `\count` registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
  \e@alloc@whatsit@count User whatsits (default 261)
  \e@alloc@bytecode@count Lua bytecodes (default 262)
  \e@alloc@luachunk@count Lua chunks (default 263)
```

(`\count 256` is used for `\newmarks` allocation and `\count 257` is used for `\newXeTeXintercharclass` with Xe<sub>T</sub><sub>E</sub>X, with code defined in `ltfinal.dtx`). With any L<sup>A</sup><sub>T</sub><sub>E</sub>X 2<sub>ε</sub> kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L<sup>A</sup><sub>T</sub><sub>E</sub>X 2<sub>ε</sub> kernel did not provide any functionality for the extended allocation area).

### 73 Core <sub>T</sub><sub>E</sub>X functionality

The commands defined here are defined for possible inclusion in a future L<sup>A</sup><sub>T</sub><sub>E</sub>X format, however also extracted to the file `ltluatex.tex` which may be used with older L<sup>A</sup><sub>T</sub><sub>E</sub>X formats, and with plain <sub>T</sub><sub>E</sub>X.

```
\newattribute \newattribute{<attribute>}
  Defines a named \attribute, indexed from 1 (i.e. \attribute0 is never defined).
  Attributes initially have the marker value -"7FFFFFFF ('unset') set by the engine.
\newcatcodetable \newcatcodetable{<catcodetable>}
  Defines a named \catcodetable, indexed from 1 (\catcodetable0 is never assigned).
  A new catcode table will be populated with exactly those values assigned by IniTEX
  (as described in the LuaTEX manual).
\newluafunction \newluafunction{<function>}
  Defines a named \luafunction, indexed from 1. (Lua indexes tables from 1 so
  \luafunction0 is not available).
  \newwhatsit \newwhatsit{<whatsit>}
  Defines a custom \whatsit, indexed from 1.
\newluabytecode \newluabytecode{<bytecode>}
```

|                                     |                                                                                                                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | Allocates a number for Lua bytecode register, indexed from 1.                                                                                                                                                                     |
| <code>\newluachunkname</code>       | <code>newluachunkname{⟨chunkname⟩}</code><br>Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the register (without backslash) into the <code>lua.name</code> table to be used in stack traces. |
| <code>\catcodetable@initex</code>   | Predefined category code tables with the obvious assignments. Note that the                                                                                                                                                       |
| <code>\catcodetable@string</code>   | <code>latex</code> and <code>atletter</code> tables set the full Unicode range to the codes predefined by                                                                                                                         |
| <code>\catcodetable@latex</code>    | the kernel.                                                                                                                                                                                                                       |
| <code>\catcodetable@atletter</code> | <code>\setattribute{⟨attribute⟩}{⟨value⟩}</code>                                                                                                                                                                                  |
| <code>\setattribute</code>          | <code>\unsetattribute{⟨attribute⟩}</code>                                                                                                                                                                                         |
| <code>\unsetattribute</code>        | Set and unset attributes in a manner analogous to <code>\setlength</code> . Note that attributes take a marker value when unset so this operation is distinct from setting the value to zero.                                     |

## 74 Plain T<sub>E</sub>X interface

The `ltluatex` interface may be used with plain T<sub>E</sub>X using `\input{ltluatex}`. This inputs `ltluatex.tex` which inputs `etex.src` (or `etex.sty` if used with L<sup>A</sup>T<sub>E</sub>X) if it is not already input, and then defines some internal commands to allow the `ltluatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T<sub>E</sub>X, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `ltluatex` code but implements a compatibility layer providing the interface of the original package.

## 75 Lua functionality

### 75.1 Allocators in Lua

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>new_attribute</code>   | <code>luatexbase.new_attribute(⟨attribute⟩)</code><br>Returns an allocation number for the <code>⟨attribute⟩</code> , indexed from 1. The attribute will be initialised with the marker value <code>-"7FFFFFFF</code> ('unset'). The attribute allocation sequence is shared with the T <sub>E</sub> X code but this function does <i>not</i> define a token using <code>\attributedef</code> . The attribute name is recorded in the <code>attributes</code> table. A metatable is provided so that the table syntax can be used consistently for attributes declared in T <sub>E</sub> X or Lua. |
| <code>new_whatsit</code>     | <code>luatexbase.new_whatsit(⟨whatsit⟩)</code><br>Returns an allocation number for the custom <code>⟨whatsit⟩</code> , indexed from 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>new_bytecode</code>    | <code>luatexbase.new_bytecode(⟨bytecode⟩)</code><br>Returns an allocation number for a bytecode register, indexed from 1. The optional <code>⟨name⟩</code> argument is just used for logging.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>new_chunkname</code>   | <code>luatexbase.new_chunkname(⟨chunkname⟩)</code><br>Returns an allocation number for a Lua chunk name for use with <code>\directlua</code> and <code>\latelua</code> , indexed from 1. The number is returned and also <code>⟨name⟩</code> argument is added to the <code>lua.name</code> array at that index.                                                                                                                                                                                                                                                                                   |
| <code>new_luafunction</code> | <code>luatexbase.new_luafunction(⟨functionname⟩)</code><br>Returns an allocation number for a lua function for use with <code>\luafunction</code> , <code>\lateluafunction</code> , and <code>\luaodef</code> , indexed from 1. The optional <code>⟨functionname⟩</code> argument is just used for logging.                                                                                                                                                                                                                                                                                        |

These functions all require access to a named T<sub>E</sub>X count register to manage their allocations. The standard names are those defined above for access from T<sub>E</sub>X, *e.g.* “e@alloc@attribute@count, but these can be adjusted by defining the variable `<type>_count_name` before loading `ltluatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a T<sub>E</sub>X `\count` (`\countdef`'d token) called `attributetracker` in place of “e@alloc@attribute@count.

## 75.2 Lua access to T<sub>E</sub>X register numbers

`registernumber` `luatexbase.registernumber(<name>)`  
 Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by T<sub>E</sub>X. This package provides a function to look up the relevant number using LuaT<sub>E</sub>X's internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumber("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumber("#1") or "bad input")}%
}}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@@n}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with LuaL<sup>A</sup>T<sub>E</sub>X then the following would be produced in the log and terminal output.

```

undefinedrubbish: \relax
    bad input
space: macro:->
    bad input
hbox: \hbox
    bad input
@MM: \mathchar"4E20
    20000
@tempdima: \dimen14
    14
@tempdimb: \dimen15
    15
strutbox: \char"B
    11
sixt@n: \char"10
    16
myattr: \attribute12
    12

```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

### 75.3 Module utilities

`provides_module` `luatexbase.provides_module(<info>)`  
This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L<sup>A</sup>T<sub>E</sub>X format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored.

`module_info` `luatexbase.module_info(<module>, <text>)`  
`module_warning` `luatexbase.module_warning(<module>, <text>)`  
`module_error` `luatexbase.module_error(<module>, <text>)`

These functions are similar to L<sup>A</sup>T<sub>E</sub>X's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done, you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

### 75.4 Callback management

`add_to_callback` `luatexbase.add_to_callback(<callback>, <function>, <description>)` Registers the `<function>` into the `<callback>` with a textual `<description>` of the function. Functions are inserted into the callback in the order loaded.  
`remove_from_callback` `luatexbase.remove_from_callback(<callback>, <description>)` Removes the call-

back function with  $\langle description \rangle$  from the  $\langle callback \rangle$ . The removed function and its description are returned as the results of this function.

|                                    |                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>in_callback</code>           | <code>luatexbase.in_callback(<math>\langle callback \rangle</math>, <math>\langle description \rangle</math>)</code> Checks if the $\langle description \rangle$ matches one of the functions added to the list for the $\langle callback \rangle$ , returning a boolean value.                                                                                                  |
| <code>disable_callback</code>      | <code>luatexbase.disable_callback(<math>\langle callback \rangle</math>)</code> Sets the $\langle callback \rangle$ to <code>false</code> as described in the LuaTeX manual for the underlying <code>callback.register</code> built-in. Callbacks will only be set to <code>false</code> (and thus be skipped entirely) if there are no functions registered using the callback. |
| <code>callback_descriptions</code> | A list of the descriptions of functions registered to the specified callback is returned. <code>{}</code> is returned if there are no functions registered.                                                                                                                                                                                                                      |
| <code>create_callback</code>       | <code>luatexbase.create_callback(<math>\langle name \rangle</math>, <math>\langle metatype \rangle</math>, <math>\langle default \rangle</math>)</code> Defines a user defined callback. The last argument is a default function or <code>false</code> .                                                                                                                         |
| <code>call_callback</code>         | <code>luatexbase.call_callback(<math>\langle name \rangle</math>, ...)</code> Calls a user defined callback with the supplied arguments.                                                                                                                                                                                                                                         |

## 76 Implementation

```

1 (*2kernel | tex | latexrelease)
2 (2kernel | latexrelease)\ifx\directlua\@undefined\else

```

### 76.1 Minimum LuaTeX version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LuaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```

3 (latexrelease)\IncludeInRelease{2015/10/01}
4 (latexrelease)          {\newluafunction}{LuaTeX}%
5 \ifnum\luatexversion<60 %
6   \wlog{*****}
7   \wlog{* LuaTeX version too old for ltuatex support *}
8   \wlog{*****}
9   \expandafter\endinput
10 \fi

```

### 76.2 Older L<sup>A</sup>TeX/Plain T<sub>E</sub>X setup

```

11 (*tex)

```

Older L<sup>A</sup>TeX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```

12 \directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}
13 \ifx\@alloc\@undefined

```

In pre-2014 L<sup>A</sup>TeX, or plain T<sub>E</sub>X, load `etex.{sty,src}`.

```

14 \ifx\documentclass\@undefined
15   \ifx\loccount\@undefined
16     \input{etex.src}%
17   \fi
18   \catcode'\@=11 %

```

```

19 \outer\expandafter\def\csname newfam\endcsname
20 \ifx\directlua\undefined {\alloc@8\fam\chardef\et@xmaxfam}
21 \else
22 \RequirePackage{etex}
23 \expandafter\def\csname newfam\endcsname
24 \ifx\directlua\undefined {\alloc@8\fam\chardef\et@xmaxfam}
25 \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
26 \fi

```

### 76.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to `etex.src` which already has some Lua<sub>T</sub><sub>E</sub><sub>X</sub>-specific code, but does not define the correct range for Lua<sub>T</sub><sub>E</sub><sub>X</sub>.

2015-07-13 higher range in luatex.

```
27 \edef \et@xmaxregs {\ifx\directlua\undefined 32768\else 65536\fi}
```

luatex/xetex also allow more math fam.

```
28 \edef \et@xmaxfam {\ifx\Umathchar\undefined\sixt@@n\else@cclvi\fi}
```

```

29 \count 270=\et@xmaxregs % locally allocates \count registers
30 \count 271=\et@xmaxregs % ditto for \dimen registers
31 \count 272=\et@xmaxregs % ditto for \skip registers
32 \count 273=\et@xmaxregs % ditto for \muskip registers
33 \count 274=\et@xmaxregs % ditto for \box registers
34 \count 275=\et@xmaxregs % ditto for \toks registers
35 \count 276=\et@xmaxregs % ditto for \marks classes

```

and 256 or 16 fam. (Done above due to plain/L<sup>A</sup>T<sub>E</sub>X differences in ltuatex.)

```
36 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}
```

End of proposed changes to `etex.src`

### 76.2.2 luatex specific settings

Switch to global cf `luatex.sty` to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

37 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
38 \csname globcount\endcsname
39 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
40 \csname globdimen\endcsname
41 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
42 \csname globskip\endcsname
43 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
44 \csname globbox\endcsname

```

Define `\e@alloc` as in latex (the existing macros in `etex.src` hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```

45 \chardef\e@alloc@top=65535
46 \let\e@alloc@chardef\chardef
47 \def\e@alloc#1#2#3#4#5#6{%
48 \global\advance#3\@ne
49 \e@ch@ck{#3}{#4}{#5}#1%
50 \allocationnumber#3\relax
51 \global#2#6\allocationnumber

```

```

52 \wlog{\string#6=\string#1\the\allocationnumber}}%
53 \gdef\ech@ck#1#2#3#4{%
54 \ifnum#1<#2\else
55 \ifnum#1=#2\relax
56 #1\@cclvi
57 \ifx\count#4\advance#1 10 \fi
58 \fi
59 \ifnum#1<#3\relax
60 \else
61 \errmessage{No room for a new \string#4}%
62 \fi
63 \fi}%

```

Two simple L<sup>A</sup>T<sub>E</sub>X macros used in `ltxltx.sty`.

```

64 \long\def\@gobble#1{}
65 \long\def\@firstofone#1{#1}

```

Fix up allocations not to clash with `etex.src`.

```

66 \expandafter\csname newcount\endcsname\@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\@alloc@luachunk@count

```

End of conditional setup for plain T<sub>E</sub>X / old L<sup>A</sup>T<sub>E</sub>X.

```

72 \fi
73 </tex>

```

### 76.3 Attributes

`\newattribute` As is generally the case for the LuaT<sub>E</sub>X registers we start here from 1. Notably, some code assumes that `\attribute0` is never used so this is important in this case.

```

74 \ifx\@alloc@attribute@count\@undefined
75 \countdef\@alloc@attribute@count=258
76 \fi
77 \def\newattribute#1{%
78 \e@alloc\attribute\attributedef
79 \e@alloc@attribute@count\m@ne\@alloc@top#1%
80 }
81 \e@alloc@attribute@count=\z@

```

`\setattribute` Handy utilities.

```

\unsetattribute 82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

```

### 76.4 Category code tables

`\newcatcodetable` Category code tables are allocated with a limit half of that used by LuaT<sub>E</sub>X for everything else. At the end of allocation there needs to be an initialisation step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```

84 \ifx\@alloc@ccodetable@count\undefined
85 \countdef\@alloc@ccodetable@count=259
86 \fi
87 \def\newcatcodetable#1{%
88   \@alloc\catcodetable\chardef
89   \@alloc@ccodetable@count\m@ne{"8000}#1%
90   \initcatcodetable\allocationnumber
91 }
92 \@alloc@ccodetable@count=\z@

```

`\catcodetable@initex` Save a small set of standard tables. The Unicode data is read here in using a parser  
`\catcodetable@string` simplified from that in `load-unicode-data`: only the nature of letters needs to  
`\catcodetable@latex` be detected.  
`\catcodetable@atletter`

```

93 \newcatcodetable\catcodetable@initex
94 \newcatcodetable\catcodetable@string
95 \begingroup
96   \def\setrangecatcode#1#2#3{%
97     \ifnum#1>#2 %
98       \expandafter\@gobble
99     \else
100      \expandafter\@firstofone
101     \fi
102     {%
103       \catcode#1=#3 %
104       \expandafter\setrangecatcode\expandafter
105       {\number\numexpr#1 + 1\relax}{#2}{#3}
106     }%
107   }
108   \@firstofone{%
109     \catcodetable\catcodetable@initex
110     \catcode0=12 %
111     \catcode13=12 %
112     \catcode37=12 %
113     \setrangecatcode{65}{90}{12}%
114     \setrangecatcode{97}{122}{12}%
115     \catcode92=12 %
116     \catcode127=12 %
117     \savecatcodetable\catcodetable@string
118   \endgroup
119   }%
120 \newcatcodetable\catcodetable@latex
121 \newcatcodetable\catcodetable@atletter
122 \begingroup
123   \def\parseunicodedataI#1;#2;#3;#4\relax{%
124     \parseunicodedataII#1;#3;#2 First>\relax
125   }%
126   \def\parseunicodedataII#1;#2;#3 First>#4\relax{%

169   \catcode64=11 %
170   \savecatcodetable\catcodetable@atletter
171 }
172 \endgroup

```

## 76.5 Named Lua functions

`\newluafunction` Much the same story for allocating LuaTeX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```

173 \ifx\e@alloc@luafunction@count\undefined
174   \countdef\e@alloc@luafunction@count=260
175 \fi
176 \def\newluafunction{%
177   \e@alloc\luafunction\e@alloc\chardef
178   \e@alloc@luafunction@count\mne\e@alloc@top
179 }

```

```
180 \e@alloc@luafunction@count=\z@
```

## 76.6 Custom whatsits

`\newwhatsit` These are only settable from Lua but for consistency are definable here.

```
181 \ifx\e@alloc@whatsit@count\@undefined
182 \countdef\e@alloc@whatsit@count=261
183 \fi
184 \def\newwhatsit#1{%
185   \e@alloc\whatsit\e@alloc@chardef
186   \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
187 }
188 \e@alloc@whatsit@count=\z@
```

## 76.7 Lua bytecode registers

`\newluabytocode` These are only settable from Lua but for consistency are definable here.

```
189 \ifx\e@alloc@bytecode@count\@undefined
190 \countdef\e@alloc@bytecode@count=262
191 \fi
192 \def\newluabytocode#1{%
193   \e@alloc\luabytocode\e@alloc@chardef
194   \e@alloc@bytecode@count\m@ne\e@alloc@top#1%
195 }
196 \e@alloc@bytecode@count=\z@
```

## 76.8 Lua chunk registers

`\newluachunkname` As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```
197 \ifx\e@alloc@luachunk@count\@undefined
198 \countdef\e@alloc@luachunk@count=263
199 \fi
200 \def\newluachunkname#1{%
201   \e@alloc\luachunk\e@alloc@chardef
202   \e@alloc@luachunk@count\m@ne\e@alloc@top#1%
203   {\escapechar\m@ne
204    \directlua{lua.name[\the\allocationnumber]="\string#1"}}%
205 }
206 \e@alloc@luachunk@count=\z@
```

## 76.9 Lua loader

Load the Lua code at the start of every job. For the conversion of T<sub>E</sub>X into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```
207 (2kernel)\everyjob\expandafter{%
208 (2kernel) \the\everyjob
209 \begingroup
210 \attributedef\attributezero=0 %
211 \chardef \charzero =0 %
```

Note name change required on older luatex, for hash table access.

```
212 \countdef \CountZero =0 %
213 \dimendef \dimenzero =0 %
214 \mathchardef \mathcharzero =0 %
215 \muskipdef \muskipzero =0 %
216 \skipdef \skipzero =0 %
217 \toksdef \tokszero =0 %
218 \directlua{require("ltxlua")}
219 \endgroup
220 (2ekernel)}
221 (latexrelease)\EndIncludeInRelease

222 (latexrelease)\IncludeInRelease{0000/00/00}
223 (latexrelease) {\newluafunction}{LuaTeX}%

```

## 76.10 Lua module preliminaries

```
274 <*lua>
```

Some set up for the Lua module which is needed for all of the Lua functionality added here.

**luatexbase** Set up the table for the returned functions. This is used to expose all of the public functions.

```

275 luatexbase      = luatexbase or { }
276 local luatexbase = luatexbase

```

Some Lua best practice: use local versions of functions where possible.

```

277 local string_gsub      = string.gsub
278 local tex_count        = tex.count
279 local tex_setattribute = tex.setattribute
280 local tex_setcount     = tex.setcount
281 local texio_write_nl   = texio.write_nl

282 local luatexbase_warning
283 local luatexbase_error

```

## 76.11 Lua module utilities

### 76.11.1 Module tracking

**modules** To allow tracking of module usage, a structure is provided to store information and to return it.

```
284 local modules = modules or { }
```

**provides\_module** Local function to write to the log.

```

285 local function luatexbase_log(text)
286   texio_write_nl("log", text)
287 end

```

Modelled on `\ProvidesPackage`, we store much the same information but with a little more structure.

```

288 local function provides_module(info)
289   if not (info and info.name) then
290     luatexbase_error("Missing module name for provides_module")
291   end
292   local function spaced(text)
293     return text and (" " .. text) or ""

```

```

294 end
295 luatexbase_log(
296   "Lua module: " .. info.name
297   .. spaced(info.date)
298   .. spaced(info.version)
299   .. spaced(info.description)
300 )
301 modules[info.name] = info
302 end
303 luatexbase.provides_module = provides_module

```

### 76.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from  $\TeX$ . For errors we have to make some changes. Here we give the text of the error in the  $\LaTeX$  format then force an error from Lua to halt the run. Splitting the message text is done using `\n` which takes the place of `\MessageBreak`.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```

304 local function msg_format(mod, msg_type, text)
305   local leader = ""
306   local cont
307   local first_head
308   if mod == "LaTeX" then
309     cont = string_gsub(leader, ".", " ")
310     first_head = leader .. "LaTeX: "
311   else
312     first_head = leader .. "Module " .. msg_type
313     cont = "(" .. mod .. ")"
314     .. string_gsub(first_head, ".", " ")
315     first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":"
316   end
317   if msg_type == "Error" then
318     first_head = "\n" .. first_head
319   end
320   if string.sub(text,-1) ~= "\n" then
321     text = text .. " "
322   end
323   return first_head .. " "
324     .. string_gsub(
325       text
326       .. "on input line "
327       .. tex.inputlineno, "\n", "\n" .. cont .. " "
328     )
329     .. "\n"
330 end

```

```

module_info Write messages.
module_warning 331 local function module_info(mod, text)
module_error 332   texio_write_nl("log", msg_format(mod, "Info", text))
333 end
334 luatexbase.module_info = module_info

```

```

335 local function module_warning(mod, text)
336   texio_write_nl("term and log",msg_format(mod, "Warning", text))
337 end
338 luatexbase.module_warning = module_warning
339 local function module_error(mod, text)
340   error(msg_format(mod, "Error", text))
341 end
342 luatexbase.module_error = module_error

```

Dedicated versions for the rest of the code here.

```

343 function luatexbase_warning(text)
344   module_warning("luatexbase", text)
345 end
346 function luatexbase_error(text)
347   module_error("luatexbase", text)
348 end

```

## 76.12 Accessing register numbers from Lua

Collect up the data from the T<sub>E</sub>X level into a Lua table: from version 0.80, LuaT<sub>E</sub>X makes that easy.

```

349 local luaregisterbasetable = { }
350 local registermap = {
351   attributezero = "assign_attr"   ,
352   charzero      = "char_given"    ,
353   CountZero     = "assign_int"    ,
354   dimenzero     = "assign_dimen"  ,
355   mathcharzero  = "math_given"    ,
356   muskipzero    = "assign_mu_skip",
357   skipzero      = "assign_skip"   ,
358   tokszero      = "assign_toks"   ,
359 }
360 local createtoken
361 if tex.luatexversion > 81 then
362   createtoken = token.create
363 elseif tex.luatexversion > 79 then
364   createtoken = newtoken.create
365 end
366 local hashtokens = tex.hashtokens()
367 local luatexversion = tex.luatexversion
368 for i,j in pairs (registermap) do
369   if luatexversion < 80 then
370     luaregisterbasetable[hashtokens[i][1]] =
371       hashtokens[i][2]
372   else
373     luaregisterbasetable[j] = createtoken(i).mode
374   end
375 end

```

**registernumber** Working out the correct return value can be done in two ways. For older LuaT<sub>E</sub>X releases it has to be extracted from the `hashtokens`. On the other hand, newer LuaT<sub>E</sub>X's have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

376 local registernumber
377 if luatexversion < 80 then
378   function registernumber(name)
379     local nt = hashtokens[name]
380     if(nt and luaregisterbasetable[nt[1]]) then
381       return nt[2] - luaregisterbasetable[nt[1]]
382     else
383       return false
384     end
385   end
386 else
387   function registernumber(name)
388     local nt = createtoken(name)
389     if(luaregisterbasetable[nt.cmdname]) then
390       return nt.mode - luaregisterbasetable[nt.cmdname]
391     else
392       return false
393     end
394   end
395 end
396 luatexbase.registernumber = registernumber

```

## 76.13 Attribute allocation

`new_attribute` As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

397 local attributes=setmetatable(
398 {},
399 {
400   __index = function(t,key)
401     return registernumber(key) or nil
402   end}
403 )
404 luatexbase.attributes = attributes
405 local attribute_count_name =
406   attribute_count_name or "e@alloc@attribute@count"
407 local function new_attribute(name)
408   tex_setcount("global", attribute_count_name,
409     tex_count[attribute_count_name] + 1)
410   if tex_count[attribute_count_name] > 65534 then
411     luatexbase_error("No room for a new \\attribute")
412   end
413   attributes[name]= tex_count[attribute_count_name]
414   luatexbase_log("Lua-only attribute " .. name .. " = " ..
415     tex_count[attribute_count_name])
416   return tex_count[attribute_count_name]
417 end
418 luatexbase.new_attribute = new_attribute

```

## 76.14 Custom whatsit allocation

`new_whatsit` Much the same as for attribute allocation in Lua.

```

419 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"

```

```

420 local function new_whatsit(name)
421   tex_setcount("global", whatsit_count_name,
422               tex_count[whatsit_count_name] + 1)
423   if tex_count[whatsit_count_name] > 65534 then
424     luatexbase_error("No room for a new custom whatsit")
425   end
426   luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
427                 tex_count[whatsit_count_name])
428   return tex_count[whatsit_count_name]
429 end
430 luatexbase.new_whatsit = new_whatsit

```

## 76.15 Bytecode register allocation

`new_bytecode` Much the same as for attribute allocation in Lua. The optional  $\langle name \rangle$  argument is used in the log if given.

```

431 local bytecode_count_name =
432       bytecode_count_name or "e@alloc@bytecode@count"
433 local function new_bytecode(name)
434   tex_setcount("global", bytecode_count_name,
435               tex_count[bytecode_count_name] + 1)
436   if tex_count[bytecode_count_name] > 65534 then
437     luatexbase_error("No room for a new bytecode register")
438   end
439   luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
440                 tex_count[bytecode_count_name])
441   return tex_count[bytecode_count_name]
442 end
443 luatexbase.new_bytecode = new_bytecode

```

## 76.16 Lua chunk name allocation

`new_chunkname` As for bytecode registers but also store the name in the `lua.name` table.

```

444 local chunkname_count_name =
445       chunkname_count_name or "e@alloc@luachunk@count"
446 local function new_chunkname(name)
447   tex_setcount("global", chunkname_count_name,
448               tex_count[chunkname_count_name] + 1)
449   local chunkname_count = tex_count[chunkname_count_name]
450   chunkname_count = chunkname_count + 1
451   if chunkname_count > 65534 then
452     luatexbase_error("No room for a new chunkname")
453   end
454   lua.name[chunkname_count]=name
455   luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
456                 chunkname_count .. "\n")
457   return chunkname_count
458 end
459 luatexbase.new_chunkname = new_chunkname

```

## 76.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional  $\langle name \rangle$  argument is used in the log if given.

```
460 local luafunction_count_name =
461         luafunction_count_name or "e@alloc@luafunction@count"
462 local function new_luafunction(name)
463   tex_setcount("global", luafunction_count_name,
464               tex_count[luafunction_count_name] + 1)
465   if tex_count[luafunction_count_name] > 65534 then
466     luatexbase_error("No room for a new luafunction register")
467   end
468   luatexbase_log("Lua function " .. (name or "") .. " = " ..
469                 tex_count[luafunction_count_name])
470   return tex_count[luafunction_count_name]
471 end
472 luatexbase.new_luafunction = new_luafunction
```

## 76.18 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

### 76.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

```
473 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```
474 local list, data, exclusive, simple = 1, 2, 3, 4
475 local types = {
476   list      = list,
477   data      = data,
478   exclusive = exclusive,
479   simple    = simple,
480 }
```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
```

in plain Lua<sub>T</sub><sub>E</sub>X. (Some undocumented callbacks are omitted as they are to be removed.)

```
481 local callbacktypes = callbacktypes or {
```

Section 8.2: file discovery callbacks.

```
482 find_read_file      = exclusive,
483 find_write_file     = exclusive,
484 find_font_file      = data,
485 find_output_file    = data,
486 find_format_file    = data,
487 find_vf_file        = data,
488 find_map_file       = data,
489 find_enc_file       = data,
490 find_pk_file        = data,
491 find_data_file      = data,
492 find_opentype_file  = data,
493 find_truetype_file  = data,
494 find_type1_file     = data,
495 find_image_file     = data,
```

```
496 open_read_file      = exclusive,
497 read_font_file      = exclusive,
498 read_vf_file        = exclusive,
499 read_map_file       = exclusive,
500 read_enc_file       = exclusive,
501 read_pk_file        = exclusive,
502 read_data_file      = exclusive,
503 read_truetype_file  = exclusive,
504 read_type1_file     = exclusive,
505 read_opentype_file  = exclusive,
```

Not currently used by luatex but included for completeness. may be used by a font handler.

```
506 find_cidmap_file   = data,
507 read_cidmap_file    = exclusive,
```

Section 8.3: data processing callbacks.

```
508 process_input_buffer = data,
509 process_output_buffer = data,
510 process_jobname      = data,
```

Section 8.4: node list processing callbacks.

```
511 contribute_filter   = simple,
512 buildpage_filter    = simple,
513 build_page_insert   = exclusive,
514 pre_linebreak_filter = list,
515 linebreak_filter    = list,
516 append_to_vlist_filter = exclusive,
517 post_linebreak_filter = list,
518 hpack_filter        = list,
519 vpack_filter        = list,
520 hpack_quality       = list,
521 vpack_quality       = list,
522 pre_output_filter   = list,
523 process_rule        = list,
```

```

524 hyphenate           = simple,
525 ligaturing          = simple,
526 kerning             = simple,
527 insert_local_par    = simple,
528 mlist_to_hlist      = list,

```

Section 8.5: information reporting callbacks.

```

529 pre_dump            = simple,
530 start_run           = simple,
531 stop_run            = simple,
532 start_page_number   = simple,
533 stop_page_number    = simple,
534 show_error_hook     = simple,
535 show_warning_message = simple,
536 show_error_message  = simple,
537 show_lua_error_hook = simple,
538 start_file          = simple,
539 stop_file           = simple,
540 call_edit           = simple,
541 finish_synctex_callback = simple,

```

Section 8.6: PDF-related callbacks.

```

542 finish_pdffile = data,
543 finish_pdfpage = data,

```

Section 8.7: font-related callbacks.

```

544 define_font         = exclusive,
545 glyph_not_found     = exclusive,
546 glyph_stream_provider = exclusive,

```

```

547 }

```

```

548 luatexbase.callbacktypes=callbacktypes

```

`callback.register` Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```

549 local callback_register = callback_register or callback.register
550 function callback.register()
551   luatexbase_error("Attempt to use callback.register() directly\n")
552 end

```

### 76.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

**simple** is for functions that don't return anything: they are called in order, all with the same argument;

**data** is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

**list** is a specialized variant of *data* for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except that for the following. If one function returns **false**, then **false** is immediately returned and the following functions are *not* called. If one function returns **true**, then the same head is passed to the next function. If all functions return **true**, then **true** is returned, otherwise the return value of the last function not returning **true** is used.

**exclusive** is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered..

Handler for **data** callbacks.

```
553 local function data_handler(name)
554   return function(data, ...)
555     for _,i in ipairs(callbacklist[name]) do
556       data = i.func(data,...)
557     end
558     return data
559   end
560 end
```

Handler for **exclusive** callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
561 local function exclusive_handler(name)
562   return function(...)
563     return callbacklist[name][1].func(...)
564   end
565 end
```

Handler for **list** callbacks.

```
566 local function list_handler(name)
567   return function(head, ...)
568     local ret
569     local alltrue = true
570     for _,i in ipairs(callbacklist[name]) do
571       ret = i.func(head, ...)
572       if ret == false then
573         luatexbase_warning(
574           "Function '" .. i.description .. "' returned false\n"
575           .. "in callback '" .. name .. "'")
576       )
577       break
578     end
579     if ret ~= true then
580       alltrue = false
581       head = ret
```

```

582     end
583   end
584   return alltrue and true or head
585 end
586 end

```

Handler for simple callbacks.

```

587 local function simple_handler(name)
588   return function(...)
589     for _,i in ipairs(callbacklist[name]) do
590       i.func(...)
591     end
592   end
593 end

```

Keep a handlers table for indexed access.

```

594 local handlers = {
595   [data]      = data_handler,
596   [exclusive] = exclusive_handler,
597   [list]      = list_handler,
598   [simple]     = simple_handler,
599 }

```

### 76.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```

600 local user_callbacks_defaults = { }

```

`create_callback` The allocator itself.

```

601 local function create_callback(name, ctype, default)
602   if not name or name == ""
603   or not ctype or ctype == ""
604   then
605     luatexbase_error("Unable to create callback:\n" ..
606                     "valid callback name and type required")
607   end
608   if callbacktypes[name] then
609     luatexbase_error("Unable to create callback '" .. name ..
610                     "':\ncallback is already defined")
611   end
612   if default ~= false and type (default) ~= "function" then
613     luatexbase_error("Unable to create callback '" .. name ..
614                     ":\ndefault is not a function")
615   end
616   user_callbacks_defaults[name] = default
617   callbacktypes[name] = types[ctype]
618 end
619 luatexbase.create_callback = create_callback

```

`call_callback` Call a user defined callback. First check arguments.

```

620 local function call_callback(name,...)
621   if not name or name == "" then

```

```

622     luatexbase_error("Unable to create callback:\n" ..
623                     "valid callback name required")
624 end

```

```

762     end
763 end
764 return d
765 end
766 luatexbase.callback_descriptions =callback_descriptions

```

`uninstall` Unlike at the T<sub>E</sub>X level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```

767 local function uninstall()
768   module_info(
769     "luatexbase",
770     "Uninstalling kernel luatexbase code"
771   )
772   callback.register = callback_register
773   luatexbase = nil
774 end
775 luatexbase.uninstall = uninstall

```

776 `</lua>`

Reset the catcode of @.

```

777 <tex>\catcode'\@=\etatcatcode\relax

```

## File O

# l<sup>t</sup>final.dtx

## 77 Final settings

This section contains the final settings for L<sup>A</sup>T<sub>E</sub>X. It initialises some debugging and typesetting parameters, sets the default `\catcodes` and `uc/lc` codes, and inputs the hyphenation file.

### 77.1 Debugging

By default, L<sup>A</sup>T<sub>E</sub>X shows statistics:

```
1 \*2kernel)
2 \tracingstats1
```

### 77.2 Typesetting parameters

```
\@lowpenalty These are penalties used internally.
\@medpenalty 3 \newcount\@lowpenalty
\@highpenalty 4 \newcount\@medpenalty
5 \newcount\@highpenalty

\newmarks Allocate extended marks types if etex is active. Placed here at the end of the
format to increase compatibility with count allocations in earlier releases.
6 \</2kernel)

81 <*/2kernel>
```

The default values of the picture and `\fbox` parameters:

```
82 \unitlength = 1pt
83 \fboxsep = 3pt
84 \fboxrule = .4pt
```

The saved value of T<sub>E</sub>X's `\maxdepth`:

```
85 \@maxdepth = \maxdepth
```

`\vsize` initialized because a `\clearpage` with `\vsize < \topskip` causes trouble. `\@colroom` and `\@colht` also initialized because `\vsize` may be set to them if a `\clearpage` is done before the `\begin{document}`

```
86 \vsize = 1000pt
87 \@colroom = \vsize
88 \@colht = \vsize
```

Initialise `\textheight` `\textwidth` and page style, to avoid internal errors if they are not set by the class.

```
89 \textheight=.5\maxdimen
90 \textwidth=\textheight
91 \ps@empty
```

### 77.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only `\lccode` but also other related data. The `\lccode` part of that at least needs to be loaded before hyphenation is tackled: XeT<sub>E</sub>X follows the standard T<sub>E</sub>X route of building patterns into the format. LuaT<sub>E</sub>X doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide `\Umathcode`.

```

154 <latexrelease> \fi
155 <latexrelease> \EndIncludeInRelease
156 <*2ekernel)

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
157 \lccode`\- =`\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
158 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define `\reserved@a` to apply `\reserved@c` to all the numbers in the range of its arguments.

```

159 \def\reserved@a#1#2{%
160   \@tempcnta#1\relax
161   \@tempcntb#2\relax
162   \reserved@b
163 }
164 \def\reserved@b{%
165   \ifnum\@tempcnta>\@tempcntb\else
166     \reserved@c\@tempcnta
167     \advance\@tempcnta\@ne
168     \expandafter\reserved@b
169   \fi
170 }

```

Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters.

```

171 \def\reserved@c#1{%
172   \count@=#1\advance\count@ by -"20
173   \uccode#1=\count@
174   \lccode#1=#1
175 }
176 \reserved@a{'\a}{'\z}
177 \reserved@a{"A0}{"BC}
178 \reserved@a{"E0}{"FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

179 \def\reserved@c#1{%
180   \count@=#1\advance\count@ by "20
181   \uccode#1=#1
182   \lccode#1=\count@
183   \sfcode#1=999
184 }
185 \reserved@a{'\A}{'\Z}
186 \reserved@a{"80}{"9C}
187 \reserved@a{"C0}{"DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

188 \uccode'\^^Y='^I % dotless i
189 \lccode'\^^Y='^Y % dotless i
190 \uccode'\^^Z='^J % dotless j, ae in OT1
191 \lccode'\^^Z='^Z % dotless j, ae in OT1
192 \lccode'\^^9d='^i % dotted I
193 \uccode'\^^9d='^9d % dotted I
194 \lccode'\^^9e='^9e % d-bar
195 \uccode'\^^9e='^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

196 \lccode'\^^[='^^[ % oe in OT1

```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```
197 \lccode`\- =`\- % default hyphen char
198 \lccode 127=127 % alternate hyphen char
199 \lccode 23 =23 % textcompwordmark in T1
```

End of the conditional to select either Unicode or T1 encoding defaults.

```
200 \fi
```

This is as good a place as any to active a few XeTeX-specific settings

```
201 \ifx\XeTeXuseglyphmetrics\undefined
202 \else
203 \XeTeXuseglyphmetrics=1 %
204 \XeTeXdashbreakstate=1 %
205 \fi
```

## 77.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```
206 \InputIfFileExists{hyphen.cfg}
207     {\typeout{=====^^J%
208             Local configuration file hyphen.cfg used^^J%
209             =====}%
210     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
211     }
212     {\input{hyphen.ltx}}
213 \let\@addtofilelist\@gobble
```

```
\l@nohyphenation
```

```
214 \ifx\l@nohyphenation \undefined
215 \newlanguage\l@nohyphenation
216 \fi
```

`\document@default@language` Default document language. `-1` acts as language 0, but used as a flag in `\document` to see if it has been set in the preamble.

```
217 </2ekernel>
218 <*2ekernel | latexrelease>
219 <latexrelease>\IncludeInRelease{2017/04/15}%
220 <latexrelease>           {\document@default@language}{Save language for hyphenation}%
221 \let\document@default@language\m@ne
222 </2ekernel | latexrelease>
223 <latexrelease>\EndIncludeInRelease
224 <latexrelease>\IncludeInRelease{0000/00/00}%
225 <latexrelease>           {\document@default@language}{Save language for hyphenation}%
226 <latexrelease>\let\document@default@language\undefined
227 <latexrelease>\EndIncludeInRelease
228 <*2ekernel>
```

## 77.5 Font loading

Fonts loaded during the formatting process might already have changed the `\font@submax` from `0pt` to something higher. If so, we put out a bold warning.

```
229 \ifdim \font@submax >\z@

## 77.6 Input encoding

Starting with the 2018 L<sup>A</sup>T<sub>E</sub>X release default the inputencoding to UTF-8. Unless the format is being used with `luatex`, `xetex`, `enctex` or `mltex`.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```
242 (/2ekernel)
243 (*2ekernel | latexrelease)
```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```
244 (latexrelease)\IncludeInRelease{2018/04/01}%
245 (latexrelease)           {\UTFviii@invalid}{UTF-8 default}%
```

Skip this section in Unicode TeX, or if MLTeX and EncTeX are enabled.

```

```

Set the ‘letter’ catcodes.

```

417 \def\reserved@c#1{\catcode#1=11\relax}
418 \reserved@a{'\A}{'\Z}
419 \reserved@a{'\a}{'\z}

```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab ( $\^^I$ ), nl ( $\^^J$ ), ff ( $\^^L$ ) and cr ( $\^^M$ ).

## 77.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the  $\TeX$  version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines ( $\XeTeX$  and  $\LuaTeX$ ) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

420 \ifnum 0%
421   \ifx\Umathcode\@undefined\else 1\fi
422   \ifx\XeTeXmathcode\@undefined\else 1\fi
423   >\z@
424 \else
425 \def\reserved@c#1{%
426   \count@=#1\advance\count@ by -"20
427   \uccode#1=\count@
428   \lccode#1=#1
429 }
430 \reserved@a{'\a}{'\z}
431 \reserved@a{"A0}{"BC}
432 \reserved@a{"E0}{"FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

433 \def\reserved@c#1{%
434   \count@=#1\advance\count@ by "20
435   \uccode#1=#1
436   \lccode#1=\count@
437   \sfcode#1=999
438 }
439 \reserved@a{'\A}{'\Z}
440 \reserved@a{"80}{"9C}

```

```
441 \reserved@a{"C0}{DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose ucode or lcode isn't quite what you'd expect.

```
442 \uccode'^Y='I % dotless i
443 \lccode'^Y='^Y % dotless i
444 \uccode'^Z='J % dotless j, ae in OT1
445 \lccode'^Z='^Z % dotless j, ae in OT1
446 \lccode'^9d='i % dotted I
447 \uccode'^9d='^9d % dotted I
448 \lccode'^9e='^9e % d-bar
449 \uccode'^9e='^d0 % d-bar
```

Finally here is one that helps hyphenation in the OT1 encoding.

```
450 \lccode'^^['^[' % oe in OT1
451 \fi % End of reset block for 8-bit engines
```

`\MakeUppercase` And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

`\@uclclist` *Note* that this implementation is subject to change! At the moment we're not providing any way to extend the list of uc/lc commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```
452 \DeclareRobustCommand{\MakeUppercase}[1]{%
453   \def\i{I}\def\j{J}%
454   \def\reserved@a##1##2{\let##1##2\reserved@a}%
455   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b@gobble}%
456   \protected@edef\reserved@a{\uppercase{#1}}%
457   \reserved@a
458 }%
459 \DeclareRobustCommand{\MakeLowercase}[1]{%
460   \def\reserved@a##1##2{\let##2##1\reserved@a}%
461   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b@gobble}%
462   \protected@edef\reserved@a{\lowercase{#1}}%
463   \reserved@a
464 }%
465 \def\@uclclist{\oe\OE\o\O\ae\AE
466   \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\th\TH}
```

The above code works, but has the nasty side-effect that if you say something like:

```
\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}
```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```
\mark{\protect\MakeUppercase Table of Contents}
{\protect\MakeUppercase Table of Contents}
```

In order to get round this, we redefine `\MakeUppercase` and `\MakeLowercase` to grab their argument and brace it. This is a very low-level hack, and is *not* recommended practice! This is an instance of a general problem that makes it unsafe to grab arguments unbraced, and probably needs a more general solution. For the moment though, this hack will do:

```
467 \protected@edef\MakeUppercase#1{\MakeUppercase{#1}}
468 \protected@edef\MakeLowercase#1{\MakeLowercase{#1}}
```

## 77.8 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

Patch file code removed.

```
469 %\IfFileExists{ltpatch.ltx}
470 % {\typeout{=====^^J%
471 %           Applying patch file ltpatch.ltx^^J%
472 %           =====}}
473 % \def\fmtversion@topatch{unknown}
474 % \input{ltpatch.ltx}
475 % \ifx\fmtversion\fmtversion@topatch
476 %   \ifx\patch@level\@undefined
477 %     \typeout{^^J^^J^^J%
478 %             !!!^^J%
479 %             !! Patch file 'ltpatch.ltx' not suitable for this^^J%
480 %             !! version of LaTeX.^^J^^J%
481 %             !! Please check if initex found an old patch file:^^J%
482 %             !! --- if so, rename it or delete it, and redo the^^J%
483 %             !! initex run.^^J%
484 %             !!!^^J%
485 %           \batchmode \@@end
486 %   \else
```

The code below adds the 'patch level' string to the first `\typeout` in the startup banner.

```
487 %   \def\fmtversion@topatch{0}%
488 %   \ifx\fmtversion@topatch\patch@level\else
489 %     \def\reserved@a\typeout##1##2\reserved@a{%
490 %       \typeout{##1 patch level \patch@level}##2}
491 %     \everyjob\expandafter\expandafter\expandafter{%
492 %       \expandafter\reserved@a\the\everyjob\reserved@a}
493 %     \let\reserved@a\relax
494 %     \the\everyjob
495 %   \fi
496 % \fi
497 % \else
498 %   \typeout{^^J^^J^^J%
499 %           !!!^^J%
500 %           !! Patch file 'ltpatch.ltx' (for version <\fmtversion@topatch>)^^J%
501 %           !! is not suitable for version <\fmtversion> of LaTeX.^^J^^J%
502 %           !! Please check if initex found an old patch file:^^J%
503 %           !! --- if so, rename it or delete it, and redo the^^J%
504 %           !!   initex run.^^J%
505 %           !!!^^J%
506 %         \batchmode \@@end
507 %   \fi
508 % \let\fmtversion@topatch\relax
509 % }{}
```

## 77.9 Freeing Memory

`\reserved@a` And just to make sure nobody relies on those definitions of `\reserved@b` and `\reserved@b` friends. These macros are reserved for use in the kernel. *Do not use them as general scratch macros.*

```
510 \let\reserved@a\@filelist
511 \let\reserved@b=\@undefined
512 \let\reserved@c=\@undefined
513 \let\reserved@d=\@undefined
514 \let\reserved@e=\@undefined
515 \let\reserved@f=\@undefined
```

`\toks`

```
516 \toks0{}
517 \toks2{}
518 \toks4{}
519 \toks6{}
520 \toks8{}
```

`\errhelp` Empty the error help message, which may have some rubbish:

```
521 \errhelp{}
```

## 77.10 Initialise file list

`\@providesfile` Initialise for use in the document. During `initex` a modified version has been used which leaves debugging information for `latexbug.tex`.

```
522 \def\@providesfile#1[#2]{%
523   \wlog{File: #1 #2}%
524   \expandafter\xdef\csname ver@#1\endcsname{#2}%
525   \endgroup}
```

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list  
`\@addtofilelist` built up so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any  $\LaTeX$  command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
526 \let\@filelist\@gobble
527 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

## 77.11 Dumping the format

Finally we make `@` into a letter, ensure the format will be in the ‘normal’ error mode, and dump everything into the format file.

```
528 \makeatother
529 \errorstopmode
530 \dump
531 </2ekernel>
```

# Change History

|                                                                                                                                                                                                                                                                 |     |

- 1991-10-17 ltcntrl.dtx LaTeX2.09  
`\@tfor:` (Rms) `\xdef` replaced by  
`\def` (See FMI's array.doc) . . . 56
- 1991-10-25 ltbibl.dtx LaTeX2.09  
`\@citex:` added `\reset@font`,  
suggested by Bernd Raichle. 401
- 1991-11-01 ltfloat.dtx LaTeX2.09  
`\footnote:` (RmS) Added  
`\let\protect\noexpand` in  
`\footnote`, `\footnotemark`,  
and `\footnotetext`, since  
`\xdef` is used . . . . . 396
- 1991-11-04 ltlists.dtx LaTeX2.09  
`\makelabel:` (RmS) added default  
definition for `\makelabel`, to  
produce an error message. . . 304
- 1991-11-04 ltplain.dtx RmS  
General: Removed `\itemitem` since  
never needed/useful with  
 $\LaTeX$ . . . . . 27
- 1991-11-06 ltbibl.dtx LaTeX2.09  
`\@citex:` added code to remove a  
leading blank . . . . . 401
- 1991-11-13 ltbibl.dtx LaTeX2.09  
`\@bibitem:` Changed counter  
`enumi` to `enumiv`, as it says in  
the comment above . . . . . 401
- 1991-11-21 ltffsini.dtx v1.1o  
`\p@reset@font:` Added extra  
braces for robustness. . . . . 228  
Changed to protected version of  
macro. . . . . 228
- 1991-11-22 ltfloat.dtx LaTeX2.09  
`\footnote:` (RmS) Added  
`\let\protect\noexpand` in  
`\@xfootnote`,  
`\@xfootnotemark`, and  
`\@xfootnotetext` . . . . . 396
- 1991-11-22 ltlists.dtx LaTeX2.09  
`\@item:` (RmS) Changed second  
call to `\makelabel` to  
`\unhbox\@tempboxa`. Avoids  
problems with side effects in  
`\makelabel` and is more  
efficient. . . . . 304
- 1991-11-27 ltffsbas.dtx v1.3a  
General: All `\family`, `\shape` etc.  
renamed to `\fontfamily` etc. 155
- 1991-11-27 ltffsini.dtx v1.2a  
General: All `\family`, `\shape` etc.  
renamed to `\fontfamily` etc. 225
- 1992-01-06 ltffsini.dtx v1.2c  
General: added `slitex` code . . . . . 225
- 1992-01-10 ltbibl.dtx LaTeX2.09  
`\@bibitem:` Changed `\c@enumiv` to  
`\value of \@listctr` . . . . . 401
- 1992-01-10 ltmath.dtx LaTeX2.09  
equation: RmS: put `\hbox` around  
`\@eqnnum` to typeset the  
equation number in text mode  
(as in the `eqnarray` env.) . . . 286
- 1992-01-10 ltthm.dtx LaTeX2.09  
`\@othm:` (RmS) Check for existence  
of theorem environment . . . . 366
- 1992-01-14 ltbibl.dtx LaTeX2.09  
`\@biblabel:` removed `\hfill` . . . 403
- 1992-01-14 ltsect.dtx 0.0  
`\@starttoc:` (RmS) added  
`\immediate` to `\openout` as all  
`\write` commands are also  
executed `\immediate` . . . . . 376
- 1992-02-26 ltbibl.dtx LaTeX2.09  
`\@lbibitem:` Added `\hfill` to  
restore left-alignment of  
bibliography labels in alpha  
style . . . . . 401
- 1992-03-18 ltdefs.dtx LaTeX2.09  
General: (RMS) changed input  
channel from 0 to  
`\inputcheck` to avoid  
conflicts with other channels  
allocated by `\newread` . . . . . 36
- 1992-03-18 ltfloat.dtx LaTeX2.09  
`\@xympar:` (RmS) added  
`\global\@ignorefalse` . . . . . 392
- `\end@float:` (RmS) changed  
`\@esphack` to `\@Espack` . . . 386
- 1992-03-18 ltlists.dtx 0.0  
General: RmS: added  
`\@nmbrlistfalse` . . . . . 301
- 1992-03-18 ltmiscen.dtx LaTeX2.09  
`\begin:` Changed `\@ignoretrue` to  
`\@ignorefalse` (as  
documented) . . . . . 272
- 1992-03-21 ltffsini.dtx v1.2d  
General: Renamed `\text` to  
`\nfss@text` to make it  
internal. . . . . 225
- 1992-05-12 ltffsbas.dtx v1.3c  
`\extract@alph@from@version:`  
Macro added. . . . . 171
- `\select@group:` Added call to `\ex-`  
`tract@alph@from@version.` . . 171
- 1992-07-26 ltffsbas.dtx v1.9a  
`\curr@fontshape:` . . . . . 165
- `\DeclareFontShape:` Introduced  
`\DeclareFontShape` . . . . . 156

- 1994-05-12 ltboxes.dtx v1.0g  
`\@finalstrut`: macro added . . . . . 319  
`\fbox`: New definition, merged  
with `\framebox` . . . . . 312  
`\framebox`: Merged `\fbox` and  
`\framebox` . . . . . 312  
`\normalcolor`: macro added for  
colour support . . . . . 310
- 1994-05-12 ltdefs.dtx v1.0p  
General: (ASAJ) Fixed a bug with  
`\relax` which was using  
`\@gobble` before defining it. . . 35  
Fixed a bug with `\relax` which  
was using `\@gobble` before  
defining it. . . . . 43
- 1994-05-12 ltfssbas.dtx v2.1j  
General: New baselinestretch  
concept . . . . . 155  
Replaced hand-protected  
commands by  
`\DeclareRobustCommand` defs . . . 155  
`\f@linespread`: New macro . . . . 163  
`\fontencoding`: Use  
`\DeclareRobustCommand`. . . . 161  
`\fontfamily`: Use  
`\DeclareRobustCommand`. . . . 162  
`\fontseries`: Use  
`\DeclareRobustCommand`. . . . 162  
`\fontshape`: Use  
`\DeclareRobustCommand`. . . . 162  
`\fontsize`: Redefined to use  
`\set@fontsize` . . . . . 163  
`\linespread`: New macro . . . . . 163  
`\mathversion`: Use  
`\DeclareRobustCommand`. . . . 163
- 1994-05-12 ltfssdcl.dtx v2.1g  
General: Allow `\relax` as  
undefined command . . . . . 202  
Allow `\relax`'ed cmds to be  
declared . . . . . 202
- 1994-05-12 ltfssini.dtx v2.1i  
General: Moved `\fontencoding` to  
fam.dtx . . . . . 225  
Moved `\fontfamily` to fam.dtx . . . 225  
Moved `\fontseries` to fam.dtx . . . 225  
Moved `\fontshape` to fam.dtx . . . 225  
Moved `\fontsize` to fam.dtx . . . 225  
Moved `\mathversion` to  
fam.dtx . . . . . 225  
Moved `\selectfont` to  
tracefnt.dtx . . . . . 225
- 1994-05-12 ltfsstrc.dtx v2.3f  
`\selectfont`: Use  
`\DeclareRobustCommand` . . . . 180
- 1994-05-12 ltoutenc.dtx 1.5a  
General: Removed the  
`\SaveAtCatcode` and  
`\RestoreAtCatcode`  
commands. . . . . 109  
Rewrote for the new  
syntax. . . . . 109, 111
- 1994-05-12 ltoutput.dtx v1.0p  
`\@writsetup`:  
`\normalcoloradded` . . . . . 434  
General: `\normalcoloradded` in  
various places (DPC). . . . . 407
- 1994-05-13 ltboxes.dtx v1.0h  
`\@arrayparboxrestore`: New  
accent system, use `\let` not  
`\def` . . . . . 315
- 1994-05-13 ltcounts.dtx v1.0f  
General: Removed `\@Ialph` . . . . 151  
Removed `\@ialph` . . . . . 151
- 1994-05-13 ltdefs.dtx v1.0q  
General: (ASAJ) Renamed  
`\DeclareProtectedCommand` to  
`\DeclareRobustCommand`.  
Removed  
`\@if@short@command`. . . . . 35  
(ASAJ) Replaces `\space` by ‘ ’  
in `\csname`. . . . . 35  
Renamed  
`\DeclareProtectedCommand` to  
`\DeclareRobustCommand`.  
Removed `\@if@short@command`.  
Moved to after the definition of  
`\@gobble`. . . . . 43
- 1994-05-13 ltdefs.dtx v1.0r  
General: (ASAJ) Added logging  
message to  
`\DeclareProtectedCommand`. . . 35  
Added logging message to  
`\DeclareProtectedCommand`. . . 43
- 1994-05-13 ltdefs.dtx v1.0s  
General: (ASAJ) Added  
`\@backslashchar`. . . . . 35  
(ASAJ) Coded `\@ifdefinable`  
more efficiently. . . . . 35  
Coded more efficiently, thanks  
to FMi. . . . . 40
- 1994-05-13 ltfiles.dtx LaTeX2e  
`\listfiles`: Stop `\listfiles`  
being run twice . . . . . 92
- 1994-05-13 ltfiles.dtx v1.0g  
`\document`: Added execution of  
`\every@size` . . . . . 86

General: Renamed `lthyphen.*` to `lthyphen.*`. . . . . 535
- 1994-06-01 ltboxes.dtx v1.0i  
`\@framebox`: Macro added. . . . . 313  
`\@ifframebox`: New version, so `\width` is correct in `\framebox` . . . . . 313  
`\fbox`: New version, using `\@framebox` . . . . . 312  
`\framebox`: New version, so `\width` is correct in `\framebox` . . . . 312
- 1994-06-01 ltlogos.dtx v1.1d  
`\LaTeX`: Add `\m@th` to force math size calculations . . . . . 82
- 1994-06-01 ltoutput.dtx v1.0w  
General: Tidied up typesetting. . 407
- 1994-06-08 ltfinal.dtx v1.0m  
General: Add patch file system . . 547
- 1994-06-09 ltfinal.dtx v1.0n  
General: For  $\TeX$ 2, do not set codes for higher half of character table. . . . . 539, 545
- 1994-06-09 ltfntcmd.dtx v3.3k  
General: Tidying and typos fixed in documentation . . . . . 254
- 1994-06-18 ltfntcmd.dtx v3.3l  
General: Added check for empty text . . . . . 254  
`\check@nocorr@`: Added check for empty text . . . . . 257
- 1994-06-22 ltfntcmd.dtx v3.3m  
General: Removed space from `\nfss@text` . . . . . 254  
Renamed `\check@nocorr` . . . . 254  
`\check@nocorr@`: Renamed `\check@nocorr` to `\text@command` to improve `\long` error message . . . . . 257  
`\DeclareTextFontCommand`: Removed space from `\nfss@text` . . . . . 256
- 1994-06-22 ltmath.dtx v1.2t classes  
`\mathindent`: Set `\mathindent` at the end of the class instead of at begin document . . . . . 289
- 1994-07-20 ltlogos.dtx v1.1e  
`\LaTeX`: Save a few tokens . . . . . 82  
`\LaTeXe`: Save a few tokens . . . . 82
- 1994-07-20 ltpage.dtx v1.0h  
`\sloppy`: Save a few tokens . . . . 406
- 1994-09-16 ltffsbas.dtx v2.1s  
`\nfss@catcodes`: Reset [ and ] as well, just in case . . . . . 167
- 1994-10-07 ltoutenc.dtx v1.5l  
General: Moved the ogonek accent. 94
- 1994-10-11 ltdirchk.dtx v1.0h  
`\@TeXversion`: Check for TeX3.14 13  
General: Modify all of `ltxcheck` again . . . . . 13
- 1994-10-12 ltsect.dtx v1.0f  
General: Doc. typos . . . . . 368
- 1994-10-14 fontdef.dtx v2.2a  
General: New coding . . . . . 231
- 1994-10-14 ltffsini.dtx v2.2a  
General: New coding for `cfg` files . 225
- 1994-10-14 ltmiscen.dtx v1.0s  
General: Move math to other file 267
- 1994-10-14 ltplain.dtx v1.1a  
General: Moved code to other files. 14
- 1994-10-15 ltffsbas.dtx v2.1t  
`\extract@alph@from@version`: Warn if math alpha is used outside math . . . . . 172
- 1994-10-18 ltboxes.dtx v1.0j  
`\@framebox`: `\leavevmode` added 313  
`\@ifframebox`: `\leavevmode` moved to `\@framebox` . . . . . 313  
`\@parboxto`: Macro added to remove misuse of `\@empty` . . 314

|                                                                |     |                                                              |     |
|----------------------------------------------------------------|-----|--------------------------------------------------------------|-----|
| General: stuff from ltpatch done . . . . .                     | 308 | 1994-10-25 ltoutenc.dtx 1.6a                                 |     |
| <code>\fbox</code> : <code>\long</code> added . . . . .        | 312 | General: Added <code>\textdollar</code> ,                    |     |
| <code>\mbox</code> : <code>\long</code> added . . . . .        | 309 | <code>\textlbrace</code> , <code>\textrbrace</code> ,        |     |
| <code>\sbox</code> : <code>\long</code> added . . . . .        | 311 | <code>\textsterling</code> ,                                 |     |

|                                                                |     | General: Rewrote                                             |     |

- `\DeclareTextSymbol` to define its argument to use the current encoding by default, to fit with `\DeclareTextCommand`. . . . . 98
- 1994-10-27 ltoutenc.dtx v1.6b
  - General: Added `\textbackslash`. 117
  - Added more defaults for OT1. 106
  - Removed the enc.def files . . . . . 94
  - Removed the files OT1enc.def, T1enc.def and OMSenc.def. . 105
  - Renamed `\textlbrace` to `\textbraceleft` and `\textrbrace` to `\textbraceright`. . . . . 117
- 1994-10-29 ltmath.dtx 1.0m
  - General: ASAJ: Added `\DeclareMathOperator`. . . . . 280
  - ASAJ: Tidied up documentation. . . . . 285
- 1994-10-29 ltmath.dtx v1.0m
  - General: ASAJ: Added `\mathellipsis`, `\mathdollar` and `\mathsterling`. . . . . 285
  - ASAJ: Removed `\dag`, `\ddag`. . 285
  - ASAJ: Renamed `\S` and `\P` to `\mathsection` and `\mathparagraph` and made them `\mathchardefs`. . . . . 285
- 1994-10-29 ltoutenc.dtx v1.6c
  - General: Added commands like `\dots` for use in text and math. . . . . 106
  - Renamed `\P`, `\S`, `\dag` and `\ddag` to `\textparagraph`, `\textsection`, `\textdagger` and `\textdaggerdbl`. . . . . 94
- 1994-10-30 ltdefs.dtx v1.2c
  - `\@onelevel@sanitize`: Macro added . . . . . 49
  - General: (CAR)`\@onelevel@sanitize` added . . . . . 35
- 1994-10-30 ltdefs.dtx v1.2f
  - General: (DPC)`\newwrite`'s moved to ltfiles . . . . . 35
- 1994-10-30 ltmath.dtx v1.0n
  - General: ASAJ: Moved the new commands to ltoutenc. . . . . 285
- 1994-10-30 ltoutenc.dtx v1.6d
  - General: Added `\DeclareTextCom-`  
`positeCommand`. . . . . 94
  - Added `\textcircled`. 94, 107, 117
  - Added `\t`. . . . . 107
  - Added math commands. . . . . 94
- Added OML encoding. . . . . 94, 107
- Added the OML encoding. . . . . 117
- Made `\textless` and `\textgreater` come from OML. . . . . 107
- Moved math commands here from ltmath. . . . . 109
- Removed `\textregistered`. . . 107
- Rewrote `\copyright` to use `\textcircled`. . . . . 107
- 1994-10-31 fontdef.dtx v2.2d
  - General: Added OMLenc.def ... . 233
- 1994-10-31 fontdef.dtx v2.2e
  - General: ... and moved further down . . . . . 233
- 1994-10-31 lfloat.dtx v1.1a
  - `\@dblfloat`: Major changes since two-column and one-column cases merged . . . . . 383
  - `\@dblfloatset`: Macro added . . . . . 382
  - Major changes to parameter parsing, setting of local variables, etc; two-column and one-column cases merged; space hacks moved . . . . . 382
  - `\@endfloatbox`: (DPC/CAR) Extra box added to remove colour resetting from vmode 388
  - `\@floatboxreset`: Macro added . 386
  - `\@footnotetext`: (DPC/CAR) Move colour setting to output routine . . . . . 396
  - `\@savemarbox`: (DPC/CAR) Extra box added for colour . . . . . 391
  - `\@setfps`: Macro added . . . . . 383
  - `\@xdblfloat`: Macros removed: `\@dblfloat`, `\@xdblfloat` . . . . . 388
  - `\@xfloat`: (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 384
  - Major changes, removing setting of local variables, space hacks etc; two-column and one-column cases merged . . . 383
  - Reset hook added . . . . . 384
  - `\@xympar`: (DPC/CAR) Extra box added since needed for floats 392
  - `\fps@dbl`: Macro added . . . . . 383
- 1994-10-31 ltoutput.dtx v1.1a
  - `\@makecol`: (DPC/CAR) Colour resetting moved to here . . . . . 430
  - `\@topnewpage`: (DPC/CAR) Extra box added to remove colour resetting from vmode . . . . . 422

- Changed to `\color@vbox` . . . . . 391  
 Use `\setnobreak` etc . . . . . 391  
`\setminipage`: Macro added . . . . . 386  
`\setnobreak`: Macro added . . . . . 386  
`\xfloat`: Added `\setminipage` 384  
 Added resetting of size and font 384  
 Changed to `\color@vbox` so  
 that large floats overflow at the  
 bottom . . . . . 384  
 Missing percents reinserted after  
 4, 8: these are not numbers. 383  
 Use `\setnobreak` . . . . . 384  
`\xympar`: Changed to  
`\color@vbox` . . . . . 392  
 1994-11-21 ltoutput.dtx v1.li  
`\@addtocurcol`: Added  
`\if@nobreak` test before float  
 box . . . . . 447, 451  
`\@specialoutput`: Added  
`\if@nobreak` test . . . . . 427  
`\@topnewpage`: Changed to  
`\color@vbox` . . . . . 422  
 1994-11-22 ltfsdcl.dtx v2.1o  
 General: wrap long lines . . . . . 202  
 1994-11-22 ltoutenc.dtx v1.6i  
 General: Corrected `\dots` so that  
 there's no kerning in  
 monowidth fonts. . . . . 94  
 Corrected typo with  
`\mathunderscore`. . . . . 94  
 Fixed empty accents. Again. . . 94  
 1994-11-24 ltdefs.dtx v1.2h  
`\newenv`: Added test for `\endgraf` 41  
 1994-11-25 ltplain.dtx v1.1f  
 General: (DPC) Comment out lots  
 of obsolete code . . . . . 14  
 1994-11-26 ltfloat.dtx v1.1b  
`\footnote`: (ASAJ) Added  
`\protected@xdef`. . . . . 396  
 1994-11-28 ltcntrl.dtx v1.0c  
 General: Documentation  
 improvements . . . . . 53  
 1994-11-30 ltfiles.dtx v1.0o  
`\dofilelist`: Macro added . . . . . 93  
`\listfiles`: Use `\dofilelist` . . 92  
`\nofiles`: There is no  
`\gobblethree`... . . . . . 88  
 1994-11-30 ltfsbas.dtx v2.1y  
`\fontshape`: Use `\current@cmd` in  
`\@enc@update`. ASAJ. . . . . 162  
 1994-11-30 ltmath.dtx 1.0q  
 General: ASAJ:  
`\DeclareMathOperator` moved  
 to AMS $\TeX$ . . . . . 280  
 1994-11-30 ltmiscen.dtx v1.0w  
`\enddocument`: (DPC) Do  
 warnings even for `\nofiles` . . 269  
 (DPC) Use `\dofilelist` . . . . . 269  
 1994-11-30 ltoutenc.dtx 1.7a  
 General: Redefined `\a` for the new  
 scheme. . . . . 105  
 1994-11-30 ltoutenc.dtx v1.6g  
 General: Removed new definitions  
 of `\patterns` and  
`\hyphenation`, since  
 encoding-specific commands  
 now expand in the mouth. . . 105  
 1994-11-30 ltoutenc.dtx v1.7a  
 General: Added new code for  
 encoding-specific commands.  
 These now expand in the  
 mouth, which means that  
 ligaturing and kerning can  
 happen. . . . . 94  
 Always load the enc.def file, so  
 that the default encoding for  
 the commands will change. . . 134  
 Redefined `\@changed@cmd` to  
 expand in the mouth. . . . . 98  
 Removed `\@changed@x@mouth`  
 since `\@changed@x` now  
 expands in the mouth. . . . . 98  
 Rewrote `\@text@composite` so it  
 allows an empty argument, or  
 an argument containing lots of  
 commands. . . . . 100  
 1994-12-01 ltfinal.dtx v1.0p  
 General: Renamed `lthyphen.*` to  
`hyphen.*`. . . . . 535  
 1994-12-01 lthyphen.dtx v1.0g  
 General: Rename `lthyphen.ltx/cfg`  
 to `hyphen.ltx/cfg` . . . . . 508  
 1994-12-01 ltplain.dtx v1.1g  
 General: (DPC) More doc changes 14  
 1994-12-02 fontdef.dtx v2.2i  
 General: Commented out `\ldots`.  
 ASAJ. . . . . 231  
 1994-12-02 ltssini.dtx v2.2c  
`\copyright`: `\copyright` is now in  
 ltoutenc. ASAJ . . . . . 228  
 1994-12-02 ltlists.dtx v1.0e  
`\@trivlist`: RmS: Added check  
 for looping . . . . . 300  
 1994-12-02 ltoutenc.dtx 1.7b  
 General: Redefined `\a` properly. . 105  
 1994-12-02 ltoutenc.dtx v1.7b  
 General: Fixed a bug with `\a`. . . 94

|                                                                                                                  |                                                                                                                                                                                                                                                                                                     |

- 1996-07-26 ltspace.dtx v1.2p  
`\if@nobreak`: put `\global` inside definition . . . . . 72
- 1996-07-27 ltffsbas.dtx v3.0q  
 General: `\if@inmath` switch removed . . . . . 164
- 1996-07-27 ltspace.dtx v1.2q  
 General: Further documentation of problems . . . . . 67
- 1996-07-27 ltspace.dtx v1.2r  
 General: Correct documentation of problems . . . . . 67
- 1996-08-02 ltfloat.dtx v1.1o  
`\xympar`: Remove `\global` before `\@ignore` . . . . . 392
- 1996-08-02 ltsect.dtx v1.0v  
`\@afterheading`: Removed `\global` before `\@nobreak` . . . . . 374
- 1996-08-02 ltspace.dtx v1.2s  
`\@Esphack`: Remove `\global` before `\@ignore` . . . . . 74
- 1996-08-25 ltffsbas.dtx v3.0r  
`\nfss@catcodes`: Reset the acute, grave and double quote chars as well . . . . . 167
- 1996-09-21 ltoutput.dtx v1.1w  
`\@writesetup`: Added `\@parboxrestore` and made consequent deletions: wait for the howls of protest . . . . . 434
- 1996-09-25 ltdirchk.dtx v1.0t  
 General: Move `ltxcheck` to separate file . . . . . 13
- 1996-09-28 ltmiscen.dtx v1.1f  
`\@xobeysp`: Moved to `ltspace.dtx` . . . . . 274
- 1996-09-28 ltspace.dtx v1.2t  
`\@xobeysp`: Moved from `ltmiscen.dtx` and redefined to use `\nobreakspace` . . . . . 79
- 1996-09-29 ltfiles.dtx v1.1g  
`\document`: Added disabling of `\@nodocument` . . . . . 87
- 1996-09-29 ltoutput.dtx v1.1x  
`\newpage`: Checks for `noskipsec` and `inlabel` added . . . . . 421
- 1996-09-29 ltsect.dtx 1.0w  
`\@noskipsectrue`: Added documentation . . . . . 369
- 1996-09-30 ltoutput.dtx v1.1y  
`\newpage`: Checks for `noskipsec` and `inlabel` removed pending further tests . . . . . 421
- 1996-10-04 ltclass.dtx v1.0v  
`\RequirePackageWithOptions`: Reset `\@unprocessedoptions` for /2269 . . . . . 491
- 1996-10-05 ltfiles.dtx v1.1h  
`\@clubpenalty`: Added setting its value . . . . . 85
- 1996-10-08 ltfntcmd.dtx v3.3u  
`\DeclareTextFontCommand`: Removed `\check@icr` when in `vmode` since it causes various errors (see pr/2157) . . . . . 256
- 1996-10-21 lttab.dtx v1.1i  
`\@array`: Use `\set@typeset@protect` . . . . . 332  
 General: Moved the code associated with `\@mkpream` into the group provided by the box, for robustness (`latex/2183`) . . . . . 331  
`\multicolumn`: Make `\multicolumn long` (`latex/2180`) . . . . . 333  
`\tabbing`: Moved the `\indent` so that the `\everypar` can remove it when necessary; this is needed because the code for items in lists has changed (see pr/22111) . . . . . 326
- 1996-10-23 ltlists.dtx v1.0m  
`\@item`: `\@nobreak` . . . . . moved into the `\everypar` and not executed unconditionally, see above . . . . . 304  
`\kern` . . . . . changed to `\setbox` . . . . . 303  
 Added setting of `\clubpenalty` and set `\@nobreakfalse` only when necessary . . . . . 304
- 1996-10-23 ltsect.dtx v1.0x  
`\@xsect`: Replaced `\hskip` . . . . . with `\setbox` . . . . . as used in `\@afterheading` . . . . . 373
- 1996-10-24 ltboxes.dtx v1.1a  
`\@arrayparboxrestore`: Added local settings of flags: dangerous! . . . . . 315  
`\@iiiminipage`: Use it or lose it (`@setminpage`): Frank will want to lose it . . . . . 316
- 1996-10-24 ltfloat.dtx v1.1p  
`\@floatboxreset`: Added local settings of flags: dangerous! . . . . . 386  
`\@marginparreset`: Added local settings of flags: dangerous! . . . . . 391

- `\@xfloat`: Added `\@nodocument` to trap floats in the preamble . 383
- 1996-10-24 `ltoutput.dtx v1.1z`
  - `\@addtocurcol`: Added `\nobreak`, etc as appropriate . . . . . 447, 451
  - `\@specialoutput`: Added `\nobreak` as appropriate . . . 427
  - `\@topnewpage`: Added `\@nodocument` to trap `\twocolumn` in the preamble 422
  - `\newpage`: Better checks for noskipsec and inlabel added, plus nobreak . . . . . 421
- 1996-10-25 `ltlists.dtx v1.0n`
  - `\endtrivlist`: Change `\indent` to `\leavevmode` . . . . . 301
  - Reset flags explicitly . . . . . 301
- 1996-10-25 `ltoutput.dtx v1.2a`
  - `\newpage`: Reset all flags explicitly . . . . . 421
- 1996-10-26 `ltlists.dtx v1.0o`
  - `\endtrivlist`: Correct typo . . . . 301
- 1996-10-27 `ltoutenc.dtx v1.8c`
  - `\@strip@args`: Removed macro . 101
  - General: Added `\r A` . . . . . 110
  - Added `\textasteriskcentered` 107, 117
  - Corrected syntax descriptions . 95
  - Removed `\aa` and `\AA` 106, 110, 113
- 1996-10-28 `ltplain.dtx v1.1u`
  - General: (CAR) More doc changes 14
  - `\dotfill`: Removed math mode . 28
- 1996-10-29 `ltplain.dtx v1.1v`
  - `\dotfill`: Got arithmetic correct (CAR) . . . . . 28
- 1996-10-29 `ltspace.dtx v1.2u`
  - `\@gnewline`: Added macro . . . . . 71
  - `\@no@lnbk`: Macro replaces `\@lnbk` and `\@nolnkb` . . . . . 70
  - `\@`: Corrected and rationalised code 71
  - `\nolinebreak`: Reimplemented both using `\@no@lnbk` . . . . . 70
- 1996-10-31 `ltfinal.dtx v1.0z`
  - General: Added extra `\lcode`, hoping it does no harm in T1 (pr/1969) . . . . . 539, 546
- 1996-10-31 `ltlists.dtx v1.0p`
  - `\@trivlist`: Added check for missing item in outer list . . . 300
- 1996-10-31 `ltsect.dtx v1.0y`
  - General: Corrected and tidied documentation; removed long lines . . . . . 368
- 1996-11-03 `ltplain.dtx v1.1w`
  - `\dotfill`: Saved tokens by using `\hb@xt@` . . . . . 28
- 1996-11-04 `lterror.dtx v1.2m`
  - `\@nodocument`: Always define `\@nodocument` in kernel, so that it can be cleared by `\document`. 63
- 1996-11-04 `ltlists.dtx v1.0q`
  - `\@trivlist`: Moved check for missing item: only checked when not inlabel flag is false 300
