```

File II

fontspec-code-load.dtx

1 The fontspec.sty loading file

Before we begin, for the rest of the package we use the `@@ expl3` module syntax with module name 'fontspec'.

```
1 <@@=fontspec>
```

The fontspec.sty file is simply set up to load the appropriate fontspec-xetex.sty or fontspec-luatex.sty file. This is performed by the following code.

```
2 <*load>
```

Lua^AT_EX

```
3 \sys_if_engine_luatex:T
4 {
5   \RequirePackage{luaotfload}
6   \lua_now:e{require("fontspec")}
7   \RequirePackageWithOptions{fontspec-luatex}
8   \endinput
9 }
```

X_EL^AT_EX

```
10 \sys_if_engine_xetex:T
11 {
12   \RequirePackageWithOptions{fontspec-xetex}
13   \endinput
14 }
```

Other If not one of the above, error and exit.

```
15 \msg_new:nnn {fontspec} {cannot-use-pdftex}
16 {
17   The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LuaTeX.\\
18   You~ must~ change~ your~ typesetting~ engine~ to,~ e.g.,~
19   "xelatex"~ or~ "lualatex"~ instead~ of~ "latex"~ or~ "pdflatex".
20 }
21 \msg_fatal:nn {fontspec} {cannot-use-pdftex}
```

Closing That's the end of the fontspec.sty file.

```
22 \endinput
23 </load>
```

File III

fontspec-code-vars.dtx

1 Declaration of variables

This file consists solely of declaration of variables used by fontspec. In some cases these variables are also initialised with default values. In time I would like to move these initialisations

Booleans

`\l_@@_firsttime_bool` As `\keys_set:nn` is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the 'firsttime' conditional.

```
1 \bool_new:N \l_@@_firsttime_bool
```

(End definition for \l_@@_firsttime_bool. This function is documented on page ??.)

```
2 \bool_new:N \l_@@_nobf_bool
```

```
3 \bool_new:N \l_@@_noit_bool
```

```
4 \bool_new:N \l_@@_nosc_bool
```

```
5 \bool_new:N \l_@@_check_bool
```

```
6 \bool_new:N \l_@@_tfm_bool
```

```
7 \bool_new:N \l_@@_atsui_bool
```

```
8 \bool_new:N \l_@@_ot_bool
```

```
9 \bool_new:N \l_@@_mm_bool
```

```
10 \bool_new:N \l_@@_harfbuzz_bool
```

```
11 \bool_new:N \l_@@_graphite_bool
```

```
12 \bool_new:N \l_@@_fontcfg_bool
```

```
13 \bool_set_true:N \l_@@_fontcfg_bool
```

For dealing with legacy maths:

```
14 \bool_new:N \g_@@_math_euler_bool
```

```
15 \bool_new:N \g_@@_math_lucida_bool
```

```
16 \bool_new:N \g_@@_pkg_euler_loaded_bool
```

For package options:

```
17 \bool_new:N \g_@@_cfg_bool
```

```
18 \bool_new:N \g_@@_math_bool
```

```
19 \bool_new:N \g_@@_euenc_bool
```

```
20 \bool_new:N \l_@@_tmpa_bool
```

```
21 \bool_new:N \l_@@_disable_defaults_bool
```

```
22 \bool_new:N \l_@@_alias_bool
```

```
23 \bool_new:N \l_@@_external_bool

```

```
26 \bool_new:N \g_@@_em_normalise_slant_bool
```

```
27 \bool_new:N \l_@@_proceed_bool
```

`\l_@@_never_check_bool` It is used to disable checking opentype script, language, and tags when running checking code that has a user-defined return path we want to allow the higher-level code to dictate the logic. TODO: tidy this up!

```
28 \bool_new:N \l_@@_never_check_bool
```

(End definition for `\l_@@_never_check_bool`. This function is documented on page ??.)

48 \RequirePackage[\g_fontspec_encoding_tl]{fontenc}
49 \tl_set_eq:NN \UTFencname \g_fontspec_encoding_tl % for xunicode if needed

```

To overcome the encoding changing the current font size, but only if a class has been loaded first:

```

50 \tl_if_in:NnT \@filelist {.cls} { \normalsize }

```

Dealing with a couple of the problems introduced by babel:

```

51 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
52 \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl
53 \AtBeginDocument
54 {
55 \tl_set_eq:NN \cyrillicencoding \g_fontspec_encoding_tl
56 \tl_set_eq:NN \latinencoding \g_fontspec_encoding_tl
57 }

```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the .aux file which is read at the beginning of the document.

```

58 \bool_if:NT \g_@@_euenc_bool
59 {
60 \LU) \cs_set_eq:NN \fontspec_tmp: \XeTeXpicfile

1.1 Font selection

`\@@_main_fontspec:nn` This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font.

```
1 \cs_new:Nn \@@_main_fontspec:nn
2   {
3     \fontspec_set_family:Nnn \f@family {#1} {#2}
4     \fontencoding { \g_@@_nfss_enc_tl }
5     \selectfont

```

(End definition for \@@_main_fontspec:nn. This function is documented on page ??.)

`\setmainfont` The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced).

They end with `\normalfont` so that if they’re used in the document, the change registers immediately.

```
7 \cs_new:Nn \@@_main_setmainfont:nn

`\setmathrm` These commands are analogous to `\setmainfont` and others, but for selecting the font used for `\mathrm`, etc. They can only be used in the preamble of the document. `\setboldmathrm` is used for specifying which fonts should be used in `\boldmath`.

`\@@_main_newfontfamily:NnnN`

The inner fontspec workings define a font family, which is then used in a typical NFSS `\fontfamily` declaration, saved in the macro name specified. The fourth argument determines which xparse function to set the macro with (new/renew/etc).

```

\addfontfeatures In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level \fontspec command.

The default options are *not* applied (which is why \g_fontspec_default_fontopts_tl is emptied inside the group; this is allowed as \l_fontspec_family_tl is globally defined in \@@_select_font_family:nn), so this means that the only added features to the font are strictly those specified by this command.

\addfontfeature is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

1.3 Defining new font features

`\newfontfeature` `\newfontfeature` takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

`\newAATfeature` This command assigns a new AAT feature by its code (`#2`,`#3`) to a new name (`#1`). Better than `\newfontfeature` because it checks if the feature exists in the font it's being used for.

1 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via `\fontspec` or from a `\newfontfamily` macro or from `\setmainfont` and so on.)

```
\fontspec_if_fontspec_font:TF Test whether the currently selected font has been loaded by fontspec.
1 \prg_new_conditional:Nnn \fontspec_if_fontspec_font: {TF,T,F}

Defines a new font family from given *features* and *font*, and stores the name in the variable *family*. See the standard fontspec user commands for applications of this function.

We want to store the actual name of the font family within the *family* variable because the actual L^AT_EX family name is automatically generated by fontspec and it's easier to keep it that way.

1.2 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if `\bfdefault` is redefined to `b`, all bold shapes defined by this package will also be assigned to `b`.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then `set_autofont` will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

```

If automatic, the `\l_@@_renderer_tl` token list will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer.

LuaTeX only supports one:

```

369 <*LU>
370 \bool_set_true:N \l_@@_ot_bool

```

(End definition for `\@@_set_font_type:N`. This function is documented on page ??.)

                    #2 : Base font name
                    #3 : Font name modifier

```

This function looks for font with $\langle name \rangle$ and $\langle modifier \rangle$ #2#3, and if found (i.e., different to font with name #2) stores it in tl #1. A modifier is something like `/B` to look for a bold font, for example.

We can't match external fonts in this way (in X_YTeX anyway; todo: test with LuaTeX). If $\langle font name tl \rangle$ is not empty, then it's already been specified by the user so abort. If $\langle Base font name \rangle$ is not given, we also abort for obvious reasons.

If $\langle font name tl \rangle$ is empty, then proceed. If not found, $\langle font name tl \rangle$ remains empty. Otherwise, we have a match.

Wrapper for `\DeclareFontShape`. And finally the actual font shape declaration using `\l_@@_nfss_tl` defined above. `\l_@@_postadjust_tl` is defined in various places to deal with things like the hyphenation character and interword spacing.

The main part is to loop through `SizeFeatures` arguments, which are of the form
`SizeFeatures={{<one>},{<two>},{<three>}}`.

`\@@_declare_shape_slanted:nn`

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the `\@@_set_slanted:` code will overwrite this anyway if necessary.

```

\@@_iv_str_to_num:Nn This macro takes a four character string and converts it to the numerical representation required for X_YTeX OpenType script/language/feature purposes. The output is stored in #1.

This code is not used in LuaTeX, as the checking for that engine is done via Lua code provided by luaotfload.

```

690 <*XE>
691 \cs_new:Nn \@@_iv_str_to_num:Nn
692 {
693   (debug)\typeout{iv_str_to_num:~#1~/~#2}
694   \@@_strip_leading_sign:Nw #1#2 \q_nil
695 }
696 \cs_generate_variant:Nn \@@_iv_str_to_num:Nn {Nx}

```

The input can be of the form of any of these: ‘abcd’, ‘abc’, ‘abc ’, ‘ab’, ‘ab ’, etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string padded with \c_empty_s, and anything beyond four chars is snipped. The \c_empty_s then are used to reconstruct the spaces in the string to number calculation.

For backwards compatibility this code also strips a leading + or -.

```

697 \cs_set:Npn \@@_strip_leading_sign:Nw #1#2#3 \q_nil
698 {
699   \bool_if:nTF { \str_if_eq_p:nn {#2} {+} || \str_if_eq_p:nn {#2} {-} }
700     { \@@_iv_str_to_num:w #1 \q_nil #3 \c_empty_tl \c_empty_tl \q_nil }
701     { \@@_iv_str_to_num:w #1 \q_nil #2#3 \c_empty_tl \c_empty_tl \q_nil }
702 }

```

If input string (after sign is stripped) is more than 4 chars, #6 will contain ‘(excess)\c_empty_tl\c_empty_tl’. Therefore use #6 to verify string length.

`\@@_make_AAT_feature_string:NmmTF`

This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 58).

For exclusive selectors, it's easy; just grab the string: For *non*-exclusive selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But X_YL_AT_EX doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to

check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in `\l_fontspec_feature_string_tl`.

1.4 General font-independent features

These features can be applied to any font.

NFSS encoding For the very brave.

```

262 {
263   \tl_gset:Nx \g_@@_nfss_enc_tl { #1 }

```

NFSS family Interactions with other packages will sometimes require setting the NFSS family explicitly. (By default fontspec auto-generates one based on the font name.)

```

265 \@@_keys_define_code:nmn {fontspec-prepare} {NFSSFamil}
266 {
267   \tl_set:Nx \l_@@_nfss_fam_tl { #1 }

```

NFSS series/shape This option looks similar in name but has a very different function.

```

```

Scale If the input isn't one of the pre-defined string options, then it's gotta be numerical. `\fontspec_calc_scale:n` does all the work in the auto-scaling cases.

```

288 \@@_keys_define_code:nnn {fontspec} {Scale}

294   }
295   { \tl_set:Nx \l_@@_scale_tl {#1} }
296 }

```

301   \@@_info:n {set-scale}
302 }

```

`\@@_calc_scale:n` This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X_YTeX).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

To begin, change to `\rmfamily` but use internal commands in case `csermfamily` has been overwritten. (Note that changing `\rmfamily` with `fontspec` resets `\encodingdefault` appropriately.)

```

303 \cs_new:Nn \@@_calc_scale:n
304 {
305   \group_begin:
306
307   \fontencoding { \encodingdefault }

323 \tl_set:Nx \l_@@_scale_tl { \l_@@_scale_tl }
324 }

```

(End definition for `\@@_calc_scale:n`. This function is documented on page ??.)

`\@@_set_font_dimen:NnN` This function sets the dimension #1 (for font #3) to 'fontdimen' #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect 'zero' value (as `\fontdimen8` might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an 'X' or an 'x'.

```

325 \cs_new:Nn \@@_set_font_dimen:NnN

```

`_fontspec_parse_wordspace:w` This macro determines if the input to `WordSpace` is of the form `{X}` or `{X,Y,Z}` and executes the font scaling. If the former input, it executes `{X,X,X}`.

```

347 \cs_set:Npn \_fontspec_parse_wordspace:w #1,#2,#3,#4 \q_stop

Hyphenation character This feature takes one of three arguments: ‘None’, *⟨glyph⟩*, or *⟨slot⟩*. If the input isn’t the first, and it’s one character, then it’s the second; otherwise, it’s the third.

These are to be specified to apply directly to a font shape:

```

520 \keys_define:nm {fontspec}
521 {
522   FakeSlant .code:n =
523   {
524     \@@_update_featstr:n {slant=#1}
525   },
526   FakeSlant .default:n = {0.2}

```

```

527 }
528 \keys_define:nn {fontspec}
529 {
530   FakeStretch .code:n =
531   {
532     \@@_update_featstr:n {extend=#1}
533   },
534   FakeStretch .default:n = {1.2}
535 }
536 <*XE>
537 \keys_define:nn {fontspec}
538 {
539   FakeBold .code:n =
540   {
541     \@@_update_featstr:n {embolden=#1}
542   },
543   FakeBold .default:n = {1.5}
544 }
545 </XE>
546 <*LU>
547 \keys_define:nn {fontspec}
548 {
549   FakeBold .code:n = { \@@_warning:n {fakebold-only-xetex} }
550 }
551 </LU>

```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create 'fake' shapes.

The behaviour is currently that only if both `AutoFakeSlant` and `AutoFakeBold` are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I'd like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```

552 \keys_define:nn {fontspec}
553 {
554   AutoFakeSlant .code:n =
555   {

```

```

570     }
571   },
572   AutoFakeSlant .default:n = {0.2}
573 }

```

Same but reversed:

```

fontspec-code-math.dtx

1 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setmainfont` and friends was run.

`\fontspec_setup_maths:` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
1 \ifpackageloaded{euler}
2   { \bool_gset_true:N \g_@@_pkg_euler_loaded_bool }
3   { \bool_gset_false:N \g_@@_pkg_euler_loaded_bool }
4 \cs_new:Nn \fontspec_setup_maths:
5   {
6     \ifpackageloaded{euler}
7       {
8         \bool_if:NTF \g_@@_pkg_euler_loaded_bool
9           { \bool_gset_true:N \g_@@_math_euler_bool }
10          { \@@_error:n {euler-too-late} }
11        }
12      {}
13 \ifpackageloaded{lucbmath}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
14 \ifpackageloaded{lucidabr}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
15 \ifpackageloaded{lucimatx}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}

```

Knuth's CM fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in \TeX 's `operators` maths font to still go back to the legacy `cmr` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the `operators` font, which is generally the main text font. (Actually, there is a `\hat` accent in `EulerFraktur`, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```
16 \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
17 \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
18 \DeclareMathAccent{\acute}    {\mathalpha}{legacymaths}{19}
19 \DeclareMathAccent{\grave}   {\mathalpha}{legacymaths}{18}
20 \DeclareMathAccent{\ddot}    {\mathalpha}{legacymaths}{127}
21 \DeclareMathAccent{\tilde}   {\mathalpha}{legacymaths}{126}
22 \DeclareMathAccent{\bar}     {\mathalpha}{legacymaths}{22}
23 \DeclareMathAccent{\breve}   {\mathalpha}{legacymaths}{21}
24 \DeclareMathAccent{\check}   {\mathalpha}{legacymaths}{20}
25 \DeclareMathAccent{\hat}     {\mathalpha}{legacymaths}{94} % too bad, euler

```

```

26 \DeclareMathAccent{\dot}      {\mathalpha}{legacymaths}{95}
27 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}

```

`\colon`: what's going on? Okay, so `:` and `\colon` in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% % fontmath.ltx:
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{"3A}
% \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
%
% % amsmath.sty:
% \renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
% \mkern-\thinmuskip{:}\mskip6mu\relax}
%
% % euler.sty:
% \DeclareMathSymbol{:}{\mathrel}{EulerFraktur}{"3A}
%
% % lucbmath.sty:
% \DeclareMathSymbol{\@tempb}{\mathpunct}{operators}{58}
% \ifx\colon\@tempb
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
% \fi
% \DeclareMathSymbol{:}{\mathrel}{operators}{58}

```

(3A₁₆ = 58₁₀) So I think, based on this summary, that it is fair to tell fontspec to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```

28 \group_begin:
29 \mathchardef\@tempa="603A \relax
30 \ifx\colon\@tempa
31 \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
32 \fi
33 \group_end:

```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```

34 \bool_if:NF \g_@@_math_euler_bool
35 {
36 \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
37 \DeclareMathSymbol{:}{\mathrel}{legacymaths}{58}
38 \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
39 \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\g_@@_mathrm_tl(...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm(...)` commands in the preamble.

Since L^AT_EX only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_@@_bfmathrm_tl`.

`\fontspec_maybe_setup_maths`: We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L^AT_EX Font Catalogue': <http://www.tug.dk/FontCatalogue/mathfonts.html>. I'm sure there are more I've missed. Do the T_EX Gyre fonts have maths support yet?

Untested: would `\unless\ifnum\Gamma=28672\relax\bool_set_false:N \g_@@_math_bool\fi` be a better test? This needs more cooperation with euler and lucida, I think.

1 Changes to the NFSS

1 (*fontspec)

1.1 Italic small caps and so on

`\sishape` These commands for actually selecting italic small caps have been defined for many years;
`\textsi` I'm inclined to drop them. They're probably used very infrequently; I personally prefer just writing `\textit{\textsc{...}}` instead.

```
2 \providecommand\itscdefault{\itdefault\scdefault}
3 \providecommand\slscdefault{\sldefault\scdefault}
4 \DeclareRobustCommand\sishape
5 {
6   \not@math@alphabet\sishape\relax
7   \fontshape{\itscdefault}\selectfont
8 }
9 \DeclareTextFontCommand{\textsi}{\sishape}
```

(End definition for `\sishape` and `\textsi`. These functions are documented on page ??.)

TeX's 'shape' font axis needs to be overloaded to support italic small caps and slanted small caps. These are the combinations to support:

```
10 \cs_new:Nn \@@_shape_merge:nn { c_@@_shape_#1_#2_tl }
11 \cs_new:Nn \@@_merge_default_shapes:
12 {
13   \tl_const:cn { \@@_shape_merge:nn \itdefault \scdefault } {\itscdefault}
14   \tl_const:cn { \@@_shape_merge:nn \sldefault \scdefault } {\slscdefault}
15   \tl_const:cn { \@@_shape_merge:nn \scdefault \itdefault } {\itscdefault}
16   \tl_const:cn { \@@_shape_merge:nn \scdefault \sldefault } {\slscdefault}
17   \tl_const:cn { \@@_shape_merge:nn \slscdefault \itdefault } {\itscdefault}
18   \tl_const:cn { \@@_shape_merge:nn \itscdefault \sldefault } {\slscdefault}
19   \tl_const:cn { \@@_shape_merge:nn \itscdefault \updefault } {\scdefault}
20   \tl_const:cn { \@@_shape_merge:nn \slscdefault \updefault } {\scdefault}
21 }
22 \@@_merge_default_shapes:
```

`\@@_merge_shape:n` These macros enable the overload on the `\. . shape` commands. First, a shape 'new+current' (prefix) or 'current+new' (suffix) is tried. If not found, fall back on the 'new' shape.

```
23 \cs_new:Nn \@@_merge_shape:n
24 {
25   \@@_if_merge_shape:nTF {#1}
26     { \fontshape { \tl_use:c { \@@_shape_merge:nn {\f@shape} {#1} } } \selectfont }
27     { \fontshape {#1} \selectfont }
28 }
```

The following is rather specific; it only returns true if the merged shape exists, but more importantly also if the merged shape is defined for the current font.

```
29 \prg_new_conditional:Nnn \@@_if_merge_shape:n {TF}
```

```

30 {
31   \bool_lazy_and:nnTF
32   { \tl_if_exist_p:c { \@@_shape_merge:nn {\f@shape} {#1} } }
33   {

35     {
36       \f@encoding/\f@family/\f@series/
37       \tl_use:c { \@@_shape_merge:nn {\f@shape} {#1} }
38     }
39   }
40   \prg_return_true: \prg_return_false:
41 }

```

(End definition for \@@_merge_shape:n. This function is documented on page ??.)

1 Patching code

1.1 Verbatims

Many thanks to Apostolos Syropoulos for discovering this problem and writing the redefinition of L^AT_EX's `verbatim` environment and `\verb*` command.

`\fontspec_visible_space:` Print U+2423: OPEN BOX, which is used to visibly display a space character.

```
2 \cs_new_protected:Nn \fontspec_visible_space:
3 {
4   \@@_primitive_font_glyph_if_exist:NnTF \font {"2423}
5     { \char"2423\scan_stop: }
6     { \fontspec_visible_space_fallback: }
7 }
```

(End definition for `\fontspec_visible_space:`. This function is documented on page ??.)

`\fontspec_visible_space_fallback:` If the current font doesn't have U+2423: OPEN BOX, use Latin Modern Mono instead.

```
8 \cs_new_protected:Nn \fontspec_visible_space_fallback:
9 {
10  {
11    \usefont{\g_fontspec_encoding_tl}{lmtt}{\f@series}{\f@shape}
12    \textvisiblespace
13  }
14 }
```

(End definition for `\fontspec_visible_space_fallback:`. This function is documented on page ??.)

`\fontspec_print_visible_spaces:` Helper macro to turn spaces (\sim 20) active and print visible space instead.

```
15 \group_begin:
16 \char_set_catcode_active:n{"20}%
17 \cs_gset:Npn\fontspec_print_visible_spaces: {%
18 \char_set_catcode_active:n{"20}%
19 \cs_set_eq:NN $\sim$ 20\fontspec_visible_space:%
20 }%
21 \group_end:
```

(End definition for `\fontspec_print_visible_spaces:`. This function is documented on page ??.)

In 2019 there will be a new kernel-supported command for generalising 'verbatim visible spaces'. For now we check if the new command is defined and disable all patching if so. In 2020, I suppose, I'll remove all the patching code here.

```
22 \AtBeginDocument

```

`\verb` Redefine `\verb` to use `\fontspec_print_visible_spaces:`.

```

33 \cs_new_protected:Npn \@@_patch_verb:
34 {
35 \def\verb

```

(End definition for `\verb` and `\verb`. These functions are documented on page ??.)*

`verbatim*` With the `verbatim` package.

```

45 \cs_new_protected:Npn \@@_patch_verbatim:

48 {
49 \cs_set:cpn {verbatim*}
50 {
51 \group_begin: \@verbatim \fontspec_print_visible_spaces: \verbatim@start
52 }
53 }

```

This is for vanilla L^AT_EX.

```

54 {
55 \cs_set:cpn {verbatim*}
56 {
57 \@verbatim \fontspec_print_visible_spaces: \@sxverbatim
58 }
59 }

```

`listingcont*` This is for `moreverb`. The main `listing*` environment inherits this definition.

```

61 \cs_new_protected:Npn \@@_patch_moreverb:

72         \@verbatim \fontspec_print_visible_spaces: \verbatim@start
73     }
