

The `keyvaltable` package*

Richard Grewe
r-g+tex@posteo.net

March 17, 2019

Abstract

The `keyvaltable` package’s main goal is to facilitate typesetting tables...

(a)	...easily and yet still looking rather nicely	through horizontal rules and alternating row background colors by default;
(b)	...in a way that separates content from presentation	by table rows that are specified as lists of key-value pairs, where the keys are column names and the corresponding values are the content of the cell in this row in the respective column;
(c)	...with re-usable layout for tables of the same type	through named table types, of which each has a list of columns as well as further properties such as the background colors of rows; each column, in turn, has a name as well as further properties such as the heading of the column and the alignment of the column’s content.

*This document corresponds to `keyvaltable` v1.0, dated 2019/03/17. The package is available online at <http://www.ctan.org/pkg/keyvaltable> and <https://github.com/Ri-Ga/keyvaltable>.

1 Usage

We start with a basic usage example. An explanation of the involved macros follows afterwards.

```
\NewKeyValTable{Recipe}{  
  amount: align=r;  
  ingredient: align=l;  
  step: align=X[l];  
}  
\begin{KeyValTable}{Recipe}  
\Row{amount=150g, ingredient=ice cream,  
  step=put into bowl}  
\Row{amount= 50g, ingredient=cherries,  
  step=heat up and add to bowl}  
\end{KeyValTable}
```

amount	ingredient	step
150g	ice cream	put into bowl
50g	cherries	heat up and add to bowl

The example code first defines a new table type, `Recipe`, along with the columns that belong to this type. There are three columns (`amount`, `ingredient`, and `step`), whose specifications are separated with semicolons. After the separating `:`, for each column, the macro configures the column alignment using the `align` key. The alignments `r` (right) and `l` (left) are the standard tabular alignments; the `X[l]` alignment is provided by the `tabu` package (see the documentation there), which is used by default for creating the tables.

After the definition of the table type, the example creates a table of the newly defined type. For this, the example uses the `KeyValTable` environment and the `\Row` macro, once for each row. The parameter `Recipe` of the `KeyValTable` identifies the type of the table. Most notably, each row can now produced by a single macro in which the content of the individual cells can be specified by pairs such as `amount=150g`, which puts “150g” into the `amount` column of the respective row.

The example above already shows that producing a rather nice-looking table – including alternating row colors as well as horizontal rules – without further ado. How the `keyvaltable` package can be used in the general case and how its visual appearance can be customized is subject of the remainder of this section.

1.1 Table Type Definition

`\NewKeyValTable` [*options*] {*tname*} {*colspecs*} [*headers*]

Table types are defined via the `\NewKeyValTable` macro, where

- *tname* is the name of the table type,
- *colspecs* is a semicolon-separated list of individual column specifications, and
- *options*, if provided, specify table type options that override the default table options; they must then be a comma-separated list of *property*=*value* pairs; the list of table options can be found at the introduction of the `KeyValTable` environment on page 4.
- *headers*, if provided, specifies custom table header rows. This argument is further described in [Section 1.6](#). If this argument is omitted, a single header

row is produced (unless `showhead=false` is provided as an option) and the individual headers in this row are determined by $\langle colspec \rangle$.

Each column specification is of the form

$$\langle colname \rangle : \langle property \rangle = \langle value \rangle , \langle property \rangle = \langle value \rangle , \dots$$

In such a specification, $\langle colname \rangle$ represents the name of the column. The $\langle property \rangle = \langle value \rangle$ pairs configure certain properties of the column. The $\langle property \rangle$ can be one of the following:

Key	Description and Possible Values	Default
<code>align</code>	This property specifies the alignment of content in the column. The $\langle value \rangle$ can be set to any column alignment understood by the <code>tabu</code> environment of the <code>tabu</code> package. This particularly includes <code>l</code> , <code>c</code> , <code>r</code> , <code>p</code> , and <code>X</code> .	<code>l</code>
<code>default</code>	This property specifies the default value of a cell in this column, i.e., in case that a <code>\Row</code> does not provide content for the cell. By default (i.e., if unset for a column), this is an empty string.	$(empty)$
<code>format</code>	This property specifies a formatting macro for content of the cell. The macro can take one argument and is provided with the content of the cell as its argument. By default, the formatting macro takes the content as is but puts a <code>\strut</code> before and after the content (to yield a better vertical spacing).	<code>\kvtStrutted</code>
<code>head</code>	This property specifies the content of the column's header row. The default value for this property is the name of the column.	$\langle colname \rangle$
<code>hidden</code>	This property specifies whether a table column shall be displayed or not. The $\langle value \rangle$ for this property can be <code>true</code> (to hide the cell; the default) or <code>false</code> (to display the cell).	<code>false</code>

1.2 Typesetting Tables

The first possibility for typesetting a table using the `keyvaltable` package, is via the `KeyValTable` environment, which the example at the beginning of this section shows. The second possibility is described in Section 1.3.

```
\begin{KeyValTable} [options] {tname}
\end{KeyValTable}
```

The `KeyValTable` environment creates a table of type $\langle tname \rangle$. The type $\langle tname \rangle$ must have been created using `\NewKeyValTable` before. The environment itself already produces a table with the columns specified for the table type, produces a header row and some horizontal lines, and sets up background colors of rows.

The $\langle options \rangle$ override default configurations, if provided, and must then be a

comma-separated list of $\langle property \rangle = \langle value \rangle$ pairs. The following $\langle property \rangle$ names are available:

Key	Description and Possible Values	Default
shape	This property specifies the table's shape. For $\langle value \rangle$, the package currently supports <code>multipage</code> and <code>onpage</code> as well as <code>tabular</code> , <code>tabularx</code> , and <code>longtable</code> . In case of <code>multipage</code> , the table may span multiple pages and on each page, the column header is repeated. In case of <code>onpage</code> , the table does not split into multiple pages. The remaining three values use the respective environment for producing the table (see Section 1.7 for the effect).	<code>multipage</code>
width	This property specifies the width of the table, if the selected shape supports it (see Section 1.7).	<code>\linewidth</code>
showhead	This property specifies whether the head row shall be shown. The $\langle value \rangle$ must be a Boolean (i.e., <code>true</code> or <code>false</code>), where <code>true</code> specifies that the head row is shown and <code>false</code> specifies that the head row is not shown.	<code>true</code>
showrules	This property specifies whether top and bottom rules as well as a rule below the head row are drawn (<code>true</code>) or not (<code>false</code>).	<code>true</code>
headalign	This property specifies the alignment for header cells. If left empty, each header cell receives the same alignment as the respective column.	<i>(empty)</i>
headfmt	This property specifies a format to be applied to all header cells. By default, the property is empty, meaning that header cells are formatted. Otherwise, the code provided as value to this key is prepended to the text of the header cells.	<i>(empty)</i>
headbg	This property specifies the background color of the head row. The $\langle value \rangle$ must be a single color specification that is understood by the <code>xcolor</code> package. The $\langle value \rangle$ is passed directly to the <code>\rowcolor</code> macro.	<code>black!14</code>

```

\NewKeyValTable[shape=onepage,
  showhead=false,
  rowbg=blue!10..blue!15,
]{TabOptions}{
  opt: align=l, format=\texttt;
  val: align=l, format=\texttt;}
\begin{table}\centering
\begin{KeyValTable}{TabOptions}
\Row{opt=shape, val=onepage}
\Row{opt=showhead, val=false}
\Row{opt=rowbg, val=blue!10..blue!15}
\end{KeyValTable}
\caption{table options demo}
\end{table}

```

shape	onepage
showhead	false
rowbg	blue!10..blue!15

Table 4: table options demo

```

\NewKeyValTable[showrules=false,headbg=blue!25,
  headalign=c,headfmt=\bfseries,
]{TabOptions2}{
  opt: align=l, format=\texttt;
  val: align=l, format=\texttt;}
\begin{KeyValTable}{TabOptions2}
\Row{opt=showrules, val=false}
\Row{opt=headbg, val=blue!25}
\Row{opt=headalign, val=c}
\Row{opt=headfmt, val=\string\bfseries}
\end{KeyValTable}

```

opt	val
showrules	false
headbg	blue!25
headalign	c
headfmt	\bfseries

Figure 1: Examples for table options

Key	Description and Possible Values	Default
rowbg	This property specifies the background colors of content rows. The format of the $\langle value \rangle$ for this property must be $\langle oddcolor \rangle . . \langle evencolor \rangle$. The first row after the header is colored with $\langle oddcolor \rangle$, the second row with $\langle evencolor \rangle$, and so forth. Both colors must be understood by the <code>xcolor</code> package.	white..black!10

Figure 1 demonstrates the $\langle options \rangle$ in examples.

$\backslash\text{Row}[\langle options \rangle]\{\langle content \rangle\}$

A table row is produced by the $\backslash\text{Row}$ macro. The $\langle content \rangle$ must be a comma-separated list of $\langle cname \rangle = \langle text \rangle$ pairs. The $\langle cname \rangle$ identifies a column that was registered for the table type $\langle tname \rangle$. The $\langle text \rangle$ specifies the content of the cell in the respective column. Each column for which no $\langle text \rangle$ is provided in $\langle content \rangle$, will result in a cell that is filled with the column's default value.

The $\langle options \rangle$ argument customizes row properties and is further explained in [Section 1.8](#).

1.3 Tables of Collected Rows

As an alternative to producing a table within a single environment, the `keyvaltable` package offers a way to scatter individual rows throughout a document and display the full table later. This method can be useful when table rows are strongly connected to portions of text outside of the table. The method then allows specifying the rows together with the connected text rather than separately in the table environment. Table types for this method are defined via `\NewKeyValTable` as previously described.

```
\AddKeyValRow{<tname>}{<content>}
```

A table row is produced by the `\AddKeyValRow` macro. The `<tname>` identifies the table type and the `<content>` provides the content of the cells in the row. The format of the `<content>` is the same as for the `\Row` macro described in Section 1.2.

```
\ShowKeyValTable[<options>]{<tname>}
```

A table of all the rows defined via `\AddKeyValRow` can be displayed by the `\ShowKeyValTable` macro. The parameters have the same meaning as for the `KeyValTable` environment. This macro resets the list of rows for the specified table type.

```
\begin{KeyValTableContent}{<tname>}
\end{KeyValTableContent}
```

For simplifying the addition of rows, the `KeyValTableContent` environment can be used. In this environment, the `\Row` macro can be used just like in the `KeyValTable` environment. The only difference is that the `KeyValTableContent` environment does not cause the table to be displayed. For displaying the content collected in `KeyValTableContent` environments, the `\ShowKeyValTable` macro can be used.

The following example demonstrates the use, based on the previously defined `Recipe` table type.

```
\AddKeyValRow{Recipe}{amount=3,
  ingredient=balls of snow,
  step=staple all 3 balls}
\begin{KeyValTableContent}{Recipe}
\Row{amount=1, ingredient=carrot,
  step=stick into top ball}
\Row{amount=2, ingredient=coffee beans,
  step=put diagonally above carrot}
\end{KeyValTableContent}
\ShowKeyValTable{Recipe}
```

amount	ingredient	step
3	balls of snow	staple all 3 balls
1	carrot	stick into top ball
2	coffee beans	put diagonally above carrot

1.4 Setting Global Defaults

```
\kvtSet{<options>}
```

The `keyvaltable` package allows changing the default values globally for the parameters of tables and columns. This can be done by using the `\kvtSet` macro.

```
\kvtSet{headbg=red,default=?,align=r}
\NewKeyValTable{Defaults}{x; y}
\begin{KeyValTable}{Defaults}
\Row{x=1}
\Row{y=4}
\end{KeyValTable}
```

x	y
1	?
?	4

Notice the use of the `\NewKeyValTable` in the example. Column properties, including the separating `:` can be omitted completely, making the definition of a table type very simple.

1.5 Row Numbering and Labeling

The mechanism of default column values enables a simple means for automatic row numbering. For this, one can use one of three row counters provided by the `keyvaltable` package: `kvtRow`, `kvtTypeRow`, and `kvtTotalRow`. The counters are explained after the following example, which demonstrates the use for the case of the `kvtRow` counter.

```
\NewKeyValTable{Numbered1}{
  line: align=r, head=\#,
        default=\theadkvtRow;
  text: align=l, head=\textbf{Text}}
\begin{KeyValTable}{Numbered1}
\Row{text=First row}
\Row{text=Second row}
\end{KeyValTable}
```

#	Text
1	First row
2	Second row

`kvtRow` The `kvtRow` counter counts the row in the *current* table. The row number excludes the header row of the table. If the table spans multiple pages, the row number also excludes the repeated headings on subsequent pages.

`kvtTypeRow` The `kvtTypeRow` counter counts the rows in the current table and includes the number of rows of all previous tables of the same type.

`kvtTotalRow` The `kvtTotalRow` counter counts the rows in the current table and includes the number of rows of all previous tables produced using the `keyvaltable` package.

Row numbering can easily be combined with row labeling. The following example shows how the `format` column property can be used for this purpose.

```
\NewKeyValTable{Labeled}{
  label: align=r, head=\textbf{\#},
         format=\kvtLabel{kvtRow};
  text: align=l, head=\textbf{Text}}
\begin{KeyValTable}{Labeled}
\Row{text=First row, label=first}
\Row{text=After row \ref{first}}
\end{KeyValTable}
```

#	Text
1	First row
2	After row 1

`\kvtLabel [labelopts] {counter} {label}`

The `\kvtLabel` macro shows the current value of the *counter* – in particular `kvtRow`, `kvtTypeRow`, and `kvtTotalRow` – and sets the *label* to the value of *counter*. When using the macro with the `format` property, only the first argument (*counter*) must be provided, as the above example shows. The second argument (*label*) is provided by the respective cell content.

The `\kvtLabel` macro should work well with packages that change the referencing, like `cleveref` or `varioref`. When using a package that adds an optional argument to the `\label` command (like `cleveref` does), the *labelopts* can be used to pass an optional argument to `\label`. This feature is demonstrated in [Section 2.1](#).

1.6 Column Spanning

Combining multiple consecutive cells in a row to a single cell (aka column spanning) can serve several purposes. The `keyvaltable` package supports the following purposes:

1. grouping of columns through cells in the table's header that span all cells in the group and assign a joint title to the group;
2. individual combinations of cells in the table data.

The remainder of this section describes how each of the purposes can be addressed in `KeyValTable` environments.

Column groups in table headers Column groups in table headers can be specified by the `<headers>` parameter of `\NewKeyValTable`. The following two examples illustrate how this parameter can be used for specifying column groups. The first example produces a single header row in which two columns are grouped with a single header, one column has a normal header, and in which one column is not provided with a header.

```
\NewKeyValTable{ColGroup}{
  id:      align=r, default=\thekvtRow.;
  amount: align=r; ingredient: align=l;
  step:    align=X[1];
}[
  amount+ingredient: head=\textbf{ingredient};
  step: head=\textbf{step}, align=l;
]
\begin{KeyValTable}{ColGroup}
\Row{amount=150g, ingredient=ice cream,
      step=put into bowl}
\Row{amount= 50g, ingredient=cherries,
      step=heat up and add to bowl}
\end{KeyValTable}
```

	ingredient	step
1.	150g ice cream	put into bowl
2.	50g cherries	heat up and add to bowl

The second example shows how multiple header rows can be specified and, particularly, how the normal column headers can be displayed through the use of “.:”.

```
\NewKeyValTable{ColGroup2}{
  date:      align=r, head=\textbf{date};
  min/Berlin: align=r, head=min;
  max/Berlin: align=r, head=max;
  min/Paris: align=r, head=min;
  max/Paris: align=r, head=max;
}[
  min/Berlin+max/Berlin+min/Paris+max/Paris:
  head=\textbf{temperature}\
  min/Paris+max/Paris: head=\textbf{Paris};
  min/Berlin+max/Berlin: head=\textbf{Berlin}\
  .:
]
\begin{KeyValTable}{ColGroup2}
\Row{date=01.01.1970,
      min/Berlin=0\degree C, max/Berlin=...}
\end{KeyValTable}
```

	temperature			
	Berlin		Paris	
date	min	max	min	max
01.01.1970	0°C	...		

The syntax for `<headers>` is as follows:

- $\langle headers \rangle$ is a list, separated by “\\”, where each element in the list specifies the columns of a single header $\langle row \rangle$.
- Each $\langle row \rangle$, in turn, is also a list. The elements of this list are separated by “;” (as in the columns specification of `\NewKeyValTable`) and each element specifies a header $\langle cell \rangle$.
- Each $\langle cell \rangle$ is of the form

$\langle col \rangle + \dots + \langle col \rangle : \langle property \rangle = \langle value \rangle , \langle property \rangle = \langle value \rangle , \dots$

where each $\langle col \rangle$ is the name of a column. The specified header cell then spans each of the listed columns. The columns must be displayed consecutively, though not necessarily in the same order in which they are specified in $\langle cell \rangle$.

- The $\langle property \rangle = \langle value \rangle$ pairs configure certain properties of the header cell. The $\langle property \rangle$ can be one of the following:

Key	Description and Possible Values	Default
<code>align</code>	This property specifies the alignment of content in the column. The $\langle value \rangle$ can be set to any column alignment understood by the <code>tabu</code> environment of the <code>tabu</code> package. This particularly includes <code>l</code> , <code>c</code> , <code>r</code> , <code>p</code> , and <code>X</code> .	<code>c</code>
<code>head</code>	This property specifies the content of the column's header row. The default value for this property is the name of the column.	

Manual column spanning with `\multicolumn` The `\multicolumn` macro can be used for the content of a cell. The effect of this is that a number of subsequent cells are spanned over with the content of the cell. The following example demonstrates the use.

```
\NewKeyValTable{MultiCol}{
  col1: align=l;
  col2: align=l;
  col3: align=l;}
\begin{KeyValTable}{MultiCol}
  \Row{col1=1, col2=\multicolumn{1}{r}{2}, col3=3}
  \Row{col1=1, col2=\multicolumn{2}{c}{2+3}}
  \Row{col1=\multicolumn{2}{c}{1+2}, col3=3}
  \Row{col1=\multicolumn{3}{c}{1+2+3}}
\end{KeyValTable}
```

col1	col2	col3
1	2	3
1	2+3	
1+2		3
1+2+3		

A word of warning: The `\multicolumn` macro implicitly constrains the ordering of columns. For instance, in the above example, switching columns 2 and 3 would lead to an error in the second row (because `col2` is the rightmost column and therefore cannot span two columns) and also in the third row (because `col1` spans two columns but the second, `col3` is not empty). Thus, column spanning via `\multicolumn` should be used with care.

1.7 Alternative Table Environments

Originally, the `keyvaltable` package uses the `tabu` package and `tabu`, resp. `longtabu` environments for typesetting the actual tables. Through the `shape` option of tables, the table environment used by `keyvaltable` tables can be changed. [Table 14](#) on the next page compares the possible shapes/environments with regards to whether they support tables that span multiple pages, whether they support X-type (variable-width) columns, and whether their width can be specified (through the `width` option). Finally, the table also displays the package(s) that must be loaded manually when the respective shapes are used. Examples can be found in [Figure 2](#) on the following page.

1.8 Special Row Formatting

Through the `<options>` argument of the `\Row[<options>]{<content>}` and the `\KeyValRow{<tname>}[<options>]{<content>}` macros, special options of the row can be configured. As with other option arguments of the `keyvaltable` package, the options must be a comma-separated list of key-value pairs. The following table lists the supported option keys and their meaning.

Key	Description and Possible Values	Default
<code>hidden</code>	This property specifies whether the row shall be hidden (true) or not (false). If only <code>hidden</code> is used without a value, this is equivalent to <code>hidden=true</code> .	<code>false</code>
<code>bg</code>	This property specifies the background color for the particular row. If left empty, the default color as determined by the <code>rowbg</code> option of the table applies.	<i>(empty)</i>
<code>above</code>	This property specifies extra vertical space above the row. Note that this space is currently not colored with the row's background color but with the page's background color. The argument, if provided, is directly passed to <code>\vspace</code> .	<i>(empty)</i>
<code>below</code>	Analogously to <code>above</code> , this property specifies extra vertical space below the row.	<i>(empty)</i>
<code>around</code>	This property is a short-hand for setting both, <code>above</code> and <code>below</code> , to the same value.	<i>(empty)</i>

The following example demonstrates the options.

```
\begin{KeyValTable}{Recipe}
\Row{amount=150g, ingredient=ice cream,
step=put into bowl}
\Row{amount= 50g, ingredient=cherries,
step=heat up and add to bowl}
\Row[hidden]{amount=25g, ingredient=cream,
step=decorate on top}
\Row[above=1ex,bg=red!10!white]{
step=serve with a smile}
\end{KeyValTable}
```

amount	ingredient	step
150g	ice cream	put into bowl
50g	cherries	heat up and add to bowl
serve with a smile		

shape	environment	multipage	X-cols	width	packages
onepage	tabu	no	yes	yes	tabu*
multipage	longtabu	yes	yes	yes	tabu*, longtable*
tabular	tabular	no	no	no	
tabularx	tabularx	no	yes	yes	tabularx
longtable	longtable	yes	no	no	longtable

Packages marked with “*” only need to be loaded if automatic loading is not disabled via the NoTabuPkg option to the keyvaltable package.

Table 14: Comparison of table shapes / environments

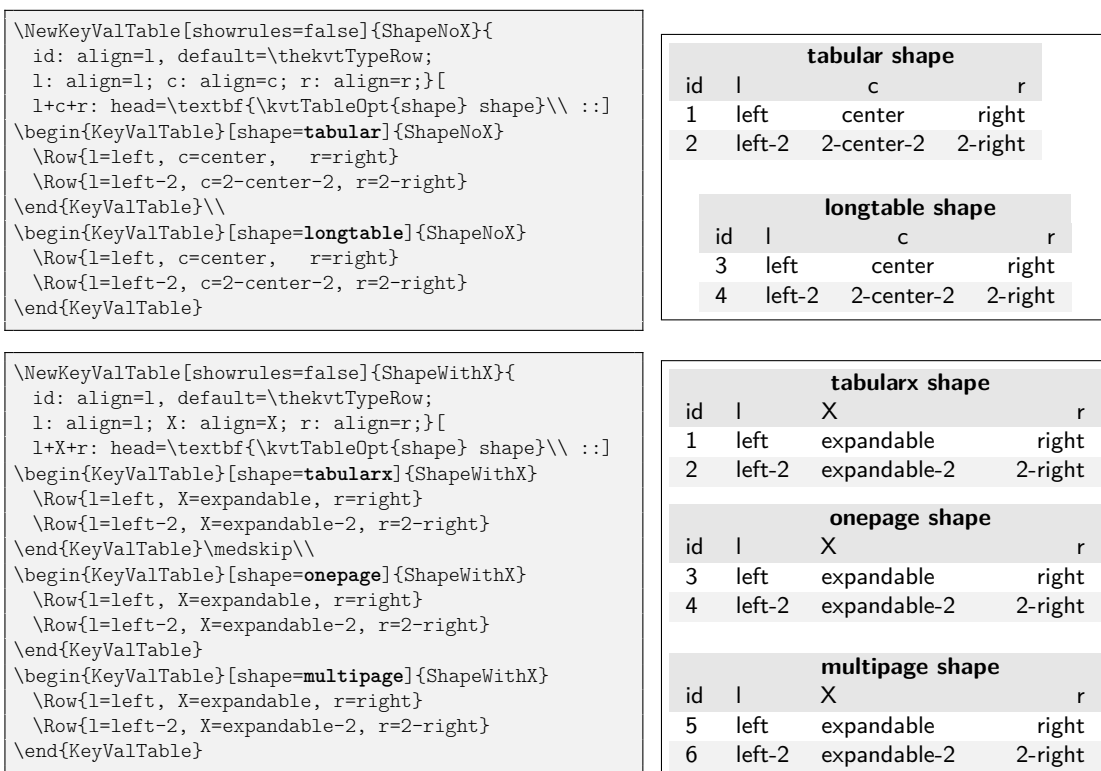

Figure 2: Examples for the shape option

1.9 Rules Between Rows

Additional horizontal rules between rows can simply be added by placing the respective rule command between `\Row` commands. The following example demonstrates this possibility.

```
\begin{KeyValTable}{Recipe}
\Row{amount=150g, ingredient=ice cream,
step=put into bowl}
\Row{amount= 50g, ingredient=cherries,
step=heat up and add to bowl}
\midrule
\Row{step=serve with a smile}
\end{KeyValTable}
```

amount	ingredient	step
150g	ice cream	put into bowl
50g	cherries	heat up and add to bowl
serve with a smile		

2 Use with Other Packages

2.1 Named References

The `\kvtLabel` feature of the `keyvaltable` package can be used together with named references, as provided by the `cleveref` package. A name to a row label can be given by using the optional first argument to the `\kvtLabel` formatting macro and specifying the name to use using `\crefname`. The following example uses “row” for the optional argument and “line” for the displayed name of the reference.

```
\usepackage{cleveref}
\crefname{row}{line}{lines}
\NewKeyValTable[headfmt=\bfseries]{NamedRef}{
label: align=r, head=Line,
format=\kvtLabel[row]{kvtRow};
text: align=l, head=Text}
\begin{KeyValTable}{NamedRef}
\Row{text=First row, label=one}
\Row{text=After \cref{one}}
\end{KeyValTable}
```

Line	Text
1	First row
2	After line 1

2.2 Computational Cells

The mechanism of cell formatting macros enables a simple means for automatically computing formulas contained in a column. This can be done, for instance using the `xint` package and defining a custom format macro (here `\Math`) that takes over the computation.

```
\usepackage{xintexpr}
\newcommand\Math[1]{%
\xinttheexpr trunc(#1, 1)\relax}
\NewKeyValTable{Calculating}{
type; value: align=r,format=\Math}
\begin{KeyValTable}{Calculating}
\Row{type=simple, value=10+5.5}
\Row{type=advanced, value=0.2*(9+2^8)}
\end{KeyValTable}
```

type	value
simple	15.5
advanced	53.0

2.3 Cell Formatting

The `keyvaltable` package can be used together with the `makecell` package in at least two ways:

1. formatting header cells using the `head` property of columns;
2. formatting content cells using the `format` property of columns.

The following example gives an impression.

```
\usepackage{makecell}
\renewcommand\theadfont{\bfseries}
\renewcommand\theadalign{lt}
\NewKeyValTable{Header}{
  first: head=\thead{short};
  second: head=\thead{two\lines}};
\begin{KeyValTable}{Header}
\Row{first=just a, second=test}
\end{KeyValTable}
```

short	two lines
just a	test

3 Related Packages

I'm not aware of any \LaTeX packages that pursue similar goals or provide similar functionality. The following \LaTeX packages provide loosely related functionalities to the `keyvaltable` package.

ctable: This package focuses on typesetting tables with captions and notes. With this package, the specification of table content is quite close to normal tabular environments, except that the package's table creation is done via a macro, `\ctable`.

easytable: This package provides an environment `TAB` which simplifies the creation of tables with particular horizontal and vertical cell alignments, rules around cells, and cell width distributions. In that sense, the package aims at simpler table creation, like `keyvaltable`. However, the package does not pursue separation of content from presentation or re-use of table layouts.

tabularkv: Despite the similarity in the name, this package pursues a different purpose. Namely, this package provides means for specifying table options such as width and height through an optional key-value argument to the `tabularkv` environment. This package does not use a key-value like specification for the content of tables.

4 Future Work

- support for further table environments, such as `xltabular`: The existing code structure should make this not too complicated. Particularly for `xltabular`, a spurious “missing } inserted” error occurs.
- improved row coloring that makes sure that the alternation re-starts on continued pages of a table that spans several pages

5 Implementation

We use `etoolbox` for some convenience macros that make the code more easily maintainable and use `xkeyval` for options in key–value form. The `trimspaces` package is used once for trimming spaces before a string comparison.

```
1 \RequirePackage{etoolbox}
2 \RequirePackage{xkeyval}
3 \RequirePackage{trimspaces}
```

We use `booktabs` for nice horizontal lines and `xcolor` for row coloring.

```
4 \PassOptionsToPackage{table}{xcolor}
5 \RequirePackage{xcolor}
6 \RequirePackage{booktabs}
```

5.1 Setting Defaults

`\kvtSet` The `\kvtSet{⟨options⟩}` set the default options, which apply to all tables typeset with the package.

```
7 \newcommand\kvtSet[1]{\bgroup
8   \def\kvt@@presetqueue{\egroup}
9   \setkeys[kvt]{defaults}{#1}{}%
10  \kvt@@presetqueue}
```

`\kvt@lazypreset` The `\kvt@@lazypreset{⟨family⟩}{⟨head keys⟩}` macro collects a request for pre-setting *⟨head keys⟩* in family key *⟨family⟩*. Using this macro, one can avoid causing problems with using `xkeyval`'s `\presetkeys` inside the *⟨function⟩* defined for a key (e.g., via `\define@key`). The collected requests can be performed by expanding the `\kvt@@presetqueue` macro.

```
11 \newcommand\kvt@lazypreset[2]{%
12   \appto\kvt@@presetqueue{\presetkeys[kvt]{#1}{#2}{}}}
```

`\kvt@addtableprop` The `\kvt@addtableprop{⟨name⟩}{⟨default⟩}` macro adds a new table option, named *⟨name⟩* and with default value *⟨default⟩*.

```
13 \newcommand\kvt@addtableprop[2]{%
14   \define@key[kvt]{defaults}{#1}{%
15     \kvt@lazypreset{Table}{#1=#1}}%
16   \presetkeys[kvt]{defaults}{#1=#2}{}%
17   \define@cmdkey[kvt]{Table}{#1}{}%
18   \presetkeys[kvt]{Table}{#1=#2}{}}
```

`\kvt@addchoicetableprop` The `\kvt@addchoicetableprop{⟨name⟩}{⟨default⟩}{⟨choice⟩}` macro adds a new table option, named *⟨name⟩* and with default value *⟨default⟩* and possible values from the comma-separated list provided by *⟨choice⟩*.

```
19 \newcommand\kvt@addchoicetableprop[3]{%
20   \define@choicekey[kvt]{defaults}{#1}{#3}{%
21     \kvt@lazypreset{Table}{#1=#1}}%
22   \presetkeys[kvt]{defaults}{#1=#2}{}%
23   \define@choicekey[kvt]{Table}{#1}{#3}%
24   {\csdef{cmdkvt@Table@#1}{#1}}%
25   \presetkeys[kvt]{Table}{#1=#2}{}}
```

`\kvt@addbooltableprop` The `\kvt@addbooltableprop{<name>}{<default>}` macro adds a new table option, named `<name>` and with default value `<default>` and possible values being booleans (true, false).

```

26 \newcommand\kvt@addbooltableprop[2]{%
27   \define@boolkey[kvt]{defaults}{#1}{%
28     \kvt@lazypreset{Table}{#1=#1}}%
29   \presetkeys[kvt]{defaults}{#1=#2}{}%
30   \define@boolkey[kvt]{Table}{#1}{%
31     {\csdef{cmdkvt@Table@#1}{#1}}%
32   \presetkeys[kvt]{Table}{#1=#2}{}}
```

`\kvt@addcolumnprop` The `\kvt@addcolumnprop{<name>}{<default>}` macro adds a new column option, named `<name>` and with default value `<default>`.

```

33 \newcommand\kvt@addcolumnprop[2]{%
The following makes the <name> available as an option for \kvtSet for setting a global default value to this column option.
34   \define@key[kvt]{defaults}{#1}{%
35     \kvt@lazypreset{Column}{#1=#1}}%
36   \presetkeys[kvt]{defaults}{#1=#2}{}%
The following makes the <name> available as an option for the <colspecs> of \NewKeyValTable for setting a default value to the particular column.
37   \define@key[kvt]{Column}{#1}{%
38     \csdef{kvt@col@#1@kvt@column}{##1}}%
39   \presetkeys[kvt]{Column}{#1=#2}{}%
40 }
```

`\kvt@addchoicecolumnprop` The `\kvt@addchoicecolumnprop{<name>}{<initial>}{<default>}{<choice>}` macro adds a new column option, named `<name>`, with initial value `<initial>`, with default argument value `<default>`, and possible values from the comma-separated list provided by `<choice>`.

```

41 \newcommand\kvt@addchoicecolumnprop[4]{%
The following makes the <name> available as an option for \kvtSet for setting a global default value to this column option.
42   \define@choicekey[kvt]{defaults}{#1}{#4}[#3]{%
43     \kvt@lazypreset{Column}{#1=#1}}%
44   \presetkeys[kvt]{defaults}{#1=#2}{}%
The following makes the <name> available as an option for the <colspecs> of \NewKeyValTable for setting a default value to the particular column.
45   \define@choicekey[kvt]{Column}{#1}{#4}[#3]{%
46     {\csdef{kvt@col@#1@kvt@column}{##1}}%
47   \presetkeys[kvt]{Column}{#1=#2}{}%
48 }
```

The following are the known column properties and their defaults as well as the known table properties and their defaults.

```

49 \kvt@addtableprop{rowbg}{white..black!10}
50 \kvt@addtableprop{headbg}{black!14}
51 \kvt@addbooltableprop{showhead}{true}
```

```

52 \kvt@addbooltableprop{showrules}{true}
53 \kvt@addtableprop{headfmt}{}
54 \kvt@addtableprop{headalign}{}
55 \kvt@addtableprop{width}{\linewidth}

```

When adding further shape options below, ensure to also add a corresponding `\kvt@DefineStdTabEnv` counterpart further below in the code.

```

56 \kvt@addchoicetableprop{shape}{multipage}{%
57   multipage, onepage, tabular, longtable, tabularx}
58 \kvt@addcolumnprop{default}{}
59 \kvt@addcolumnprop{format}{\kvtStrutted}
60 \kvt@addcolumnprop{align}{l}
61 \kvt@addcolumnprop{head}{}
62 \kvt@addchoicetableprop{hidden}{false}{true}{false, true}
63 \kvtSet{}

```

`\kvtTableOpt` The `\kvtTableOpt{<optname>}` macro, inside a `KeyValTable` environment, expands to the value of the table option `<optname>`.

```

64 \newcommand\kvtTableOpt[1]{\csname cmdkvt@Table@#1\endcsname}

```

`\kvtStrutted` The `\kvtStrutted{<arg>}` macro prefixes and suffixes the argument `<arg>` with a `\strut`. When used for formatting cell content, this makes sure that there is some vertical space between the content of a cell and the top and bottom of the row.

```

65 \newcommand\kvtStrutted[1]{\strut #1\ifhmode\expandafter\strut\fi}

```

5.2 Declaring Key-Value Tables

`\NewKeyValTable` The `\NewKeyValTable[<options>]{<tname>}{<colspecs>}[<headers>]` declares a new key-value table type, identified by the given `<tname>`. The columns of the table type are specified by `<colspecs>`. The optional `<options>`, if given, override the default table options for tables of type `<tname>`.

```

66 \newcommand\NewKeyValTable[3][]{%
67   \@ifnextchar [%]
68     {\kvt@NewKeyValTable{#1}{#2}{#3}}%
69     {\kvt@NewKeyValTable{#1}{#2}{#3} []}}

```

The `\kvt@NewKeyValTable{<options>}{<tname>}{<colspecs>}[<headers>]` macro is an auxiliary macro used for parsing the fourth, optional argument of `\NewKeyValTable`.

```

70 \def\kvt@NewKeyValTable#1#2#3[#4]{%

```

First initialize the “variables”.

```

71 \csdef{kvt@options@#2}{#1}%
72 \csdef{kvt@headings@#2}{}%

```

The following adds a zero-width column to the left of every table. This column serves the purpose of “holding” the code that `keyvaltable` uses for formatting a row (e.g., parsing `\Row` arguments). This code is partly not expandable. The reason for not putting this code into the first actual column of tables is that this code would prevent `\multicolumn` to be used in the first column. Fixme: Ideally, the whole extra column should be removed through sufficient use of `\noalign` in headers and rows, such that even the presence of `\multicolumn` does not produce errors.

```

73 \csedef{kvt@alignments@#2}{p{Opt}\expandonce\kvt@HackIntercolSpace}%
74 \csdef{kvt@colkeys@#2}{}%
75 \csdef{kvt@rowcount@#2}{0}%
76 \csdef{kvt@rows@#2}{}%
77 \csdef{kvt@headings@#2}{\kvt@defaultheader}
78 \listadd\kvt@alltables{#2}%

```

Now parse $\langle colspecs \rangle$, a semicolon-separated list of individual column specifications, and add the columns to the table. Each $\backslash do\{\langle colspec \rangle\}$ takes the specification for a single column.

```

79 \def\do##1{%
80   \kvt@parsecolspec{#2}##1::\@undefined}%
81 \kvt@dossvlist{#3}%

```

The following terminates the argument list of $\backslash kvt@defaultheader$.

```

82 \csappto{kvt@headings@#2}{\@nil}%

```

Finally, parse $\langle headers \rangle$, also a semicolon-separated list of individual column groups, where $\backslash\backslash$ marks a new row of column groups. If $\langle headers \rangle$ is omitted (or empty), then simply take the result of $\backslash kvt@parsecolspec$ as the header row.

```

83 \ifstrempy{#4}
84   {\csdef{kvt@headrowcount@#2}{1}}
85   {\kvt@parseheadrows{#2}{#4}}%
86 }

```

The $\backslash kvt@parsecolspec\{\langle tname \rangle\}\langle cname \rangle:\langle config \rangle:\langle empty \rangle\@undefined$ takes a configuration $\langle config \rangle$ for a column $\langle cname \rangle$ in table $\langle tname \rangle$ and adds the column with the configuration to the table.

```

87 \def\kvt@parsecolspec#1#2:#3:#4\@undefined{%
88   \def\kvt@column{#1@#2}%
89   \setkeys[kvt]{Column}{#3}%

```

The following stores the column's properties. The column is only added if the hidden option is not set to true.

```

90 \ifcsstring{kvt@col@hidden@#1@#2}{true}{}%
91   \cseappto{kvt@alignments@#1}{\csexpandonce{kvt@col@align@#1@#2}}%

```

Append the column heading to $\backslash kvt@headings@(\langle tname \rangle)$, which collects arguments to $\backslash kvt@defaultheader$. Hence, the appended tokens are enclosed in curly braces. If no head is specified for the column, $\langle cname \rangle$ is used for the column head. Otherwise, the head value is used.

```

92   \ifcsvoid{kvt@col@head@#1@#2}%
93     {\csappto{kvt@headings@#1}{\{#2\}}}%
94     {\cseappto{kvt@headings@#1}{\{\csexpandonce{kvt@col@head@#1@#2\}}}%
95   \listcsadd{kvt@colkeys@#1}{#2}%
96   }%

```

The following creates the column key that can be used by the row macros to set the content of the column's content in that row.

```

97 \define@cmdkey[KeyValTable]{#1}{#2}[]{}%
98 \presetkeys[KeyValTable]{#1}{#2}{}%
99 }

```

`\kvt@defaultheader` The `\kvt@defaultheader{⟨head1⟩}…{⟨headn⟩}` macro, takes n header cell titles, $\langle head1 \rangle$ to $\langle headn \rangle$ and formats them based on the `headfmt` and `headalign` options. More precisely, when fully expanded, `\kvt@defaultheader` yields “ $\langle rowcolor \rangle \& \langle fmthead1 \rangle \& \dots \& \langle fmtheadn \rangle \backslash tabularnewline$ ”. In the above, $\langle rowcolor \rangle = \backslash rowcolor \{ \langle headbg \rangle \}$.

```

100 \newcommand\kvt@defaultheader{%
101   \noexpand\rowcolor{\cmdkvt@Table@headbg}%
102   \kvt@defaultheader@i}
103 \newcommand\kvt@defaultheader@i[1]{%
104   \kvt@ifnil{#1}{\noexpand\backslash tabularnewline}{%
105     \unexpanded{&}%
106     \ifvoid\cmdkvt@Table@headalign
107       {\expandonce\cmdkvt@Table@headfmt\unexpanded{#1}}
108       {\noexpand\multicolumn{1}{\expandonce\cmdkvt@Table@headalign}
109         {\expandonce\cmdkvt@Table@headfmt\unexpanded{#1}}}%
110   \kvt@defaultheader@i}}

```

`\kvt@ifnil` The `\kvt@ifnil{⟨val⟩}{⟨iftrue⟩}{⟨iffalse⟩}` macro expands to $\langle iftrue \rangle$ if $\langle val \rangle$ is $\backslash @nil$, and expands to $\langle iffalse \rangle$ otherwise. Fixme: The `\relax` in the following is not fully ideal as it is not swallowed by the `\ifx` and therefore remains in the macro’s expansion.

```

111 \newcommand\kvt@ifnil[1]{%
112   \ifx\@nil#1\relax
113     \expandafter\@firstoftwo\else
114     \expandafter\@secondoftwo\fi}

```

`\kvt@HackIntercolSpace` The `\kvt@HackIntercolSpace` macro captures the negative space that cancels out the spacing otherwise caused by the extra column that the package adds.

```

115 \newcommand\kvt@HackIntercolSpace{%
116   @{\hspace{-.5\arrayrulewidth}}

```

`\kvt@alltables` The `\kvt@alltables` is an `etoolbox` list containing the names of all tables declared by `\NewKeyValTable`.

```

117 \newcommand\kvt@alltables{}

```

5.3 Custom Column Headers

`\kvt@parseheadrows` The `\kvt@parseheadrows{⟨tname⟩}{⟨headers⟩}` macro parses the $\langle headers \rangle$ argument of `\NewKeyValTable`.

```

118 \newcommand\kvt@parseheadrows[2]{%
119   \csdef{kvt@@colgroups@#1}{}%
120   \csdef{kvt@headrowcount@#1}{0}%
121   \bgroup
122   \def\kvt@@parseheadrows{}%

```

Now loop over $\langle headers \rangle$ to split $\langle headers \rangle$ by `\backslash`. Append each item, which specifies a single header row, to `\kvt@@parseheadrows` for subsequent parsing by `\kvt@parseheadrow`. If an item equals the special sequence “`::`”, then the original header for the columns is added as header row.

```

123   \def\do##1{%

```

```

124 \def\kvt@@tmp{##1}\trim@post@space@in\kvt@@tmp%
125 \expandafter\ifstrequal\expandafter{\kvt@@tmp}{:}%
126 {\appto\kvt@@parseheadrows{%
127 \cseappto{\kvt@@colgroups@#1}{%
128 \csexpandonce{\kvt@headings@#1}}}%
129 {\appto\kvt@@parseheadrows{\kvt@parseheadrow{#1}{##1}}}%

```

Increment the header row counter for each `\`-separated item of `\headers`.

```

130 \appto\kvt@@parseheadrows{\csedef{\kvt@headrowcount@#1}{%
131 \the\numexpr\csuse{\kvt@headrowcount@#1}+1\relax}}%
132 }\kvt@dobrclist{#2}%

```

Finally, escape the inner group and overwrite the headings with the result of the parsing.

```

133 \expandafter\egroup\kvt@@parseheadrows
134 \csletcs{\kvt@headings@#1}{\kvt@@colgroups@#1}

```

`\kvt@parseheadrow` The `\kvt@parseheadrow{<aname>}{<colspec>}` macro parses a single header row and appends the resulting table code to `\kvt@@colgroups@<aname>`.

```

135 \newcommand\kvt@parseheadrow[2]{%
136 \bgroup

```

First parse `<colspec>`, populating the `\kvt@@colgrpof@<colname>` macros that associate each column with the column group to which the column belongs.

```

137 \def\do##1{\kvt@parsehdcolspec{#1}##1::\undefined}%
138 \kvt@dossvlist{#2}%

```

Initialize variables for the subsequent loop. The `\kvt@@tmpgrphd` macro collects the code for the cells of the current header row. The `\kvt@@span` counter specifies how many columns the current cell shall span. Finally, `\kvt@@curgrp` and `\kvt@@lastgrp` hold the name of the group in which the current column and, respectively, previous column are in. Each of the two macros is undefined if there is no such column group.

```

139 \let\kvt@@tmpgrphd\@empty
140 \kvt@@span\z@
141 \undef\kvt@@curgrp \undef\kvt@@lastgrp

```

Next, loop over all displayed (non-hidden) columns stored in `\kvt@colkeys@<aname>`. The following `\do{<colname>}` collects (spanned) columns as specified in `<colspec>`, in the ordering in which the table's columns are displayed. The spanned columns are stored in `\kvt@@tmpgrphd`.

```

142 \def\do##1{\letcs\kvt@@curgrp{\kvt@@colgrpof@##1}%
143 \ifdefequal\kvt@@curgrp\kvt@@lastgrp

```

If the column group has not changed, simply increase the spanning counter.

```

144 {\advance\kvt@@span\@ne}%

```

Otherwise, i.e., if the column group has changed, then conclude the previous column (if there was one) and reset the span to 1 (to count for the column in `\kvt@@curgrp`) and set `\kvt@@lastgrp` to the current one.

```

145 {\ifnum\kvt@@span>\z@ \expandafter\kvt@concludecolumn\fi
146 \ifdefvoid\kvt@@curgrp{\ifcsdef{\kvt@@colgrpdone@}\kvt@@curgrp}{%
147 \kvt@error{Column group `'\kvt@@curgrp' must consist of only

```

```

148         consecutive columns, but it is not}%
149         {Compare `|\kvt@@curgrp|' to the column ordering as specified
150         in `string\NewKeyValTable{#1}'}}{}}%
151         \kvt@@span\@ne \let\kvt@@lastgrp\kvt@@curgrp}%
152     }\dolistcsloop{\kvt@colkeys@#1}%
153     \kvt@concludecolumn

```

Finally, conclude the whole header row and append the row to the overall list of rows, stored in `\kvt@@colgroups@{tname}`, while ending the current `TeX` group.

```

154     \appto\kvt@@tmpgrphd{\tabularnewline}%
155     \edef\do{\noexpand\csappto{\kvt@@colgroups@#1}{%
156         \noexpand\noexpand\noexpand\rowcolor{\noexpand\cmdkvt@Table@headbg}%
157         \noexpand\unexpanded{\expandonce{\kvt@@tmpgrphd}}}}}%
158     \expandafter\egroup\do}

```

`\kvt@@span` The counter `\kvt@@span` is used temporarily in macros for counting how many columns are spanned by column groups.

```
159 \newcount\kvt@@span
```

`\kvt@concludecolumn` The `\kvt@concludecolumn` macro appends a cell, potentially spanning multiple columns, to the row under construction (which is in `\kvt@@tmpgrphd`).

```
160 \newcommand\kvt@concludecolumn{%
```

The following conditional checks whether this is the first column group in the header row. If this is the case, then the `\kvt@@extraalign` macro is set to `\kvt@HackIntercolSpace`, such that the `\multicolumn` below does not throw away this spacing.

```

161     \ifdefequal\kvt@@tmpgrphd\@empty
162         {\let\kvt@@extraalign\kvt@HackIntercolSpace}
163         {\let\kvt@@extraalign\@empty}%
164     \appto\kvt@@tmpgrphd{&}%
165     \ifdefvoid\kvt@@lastgrp{}{%
166         \eappto\kvt@@tmpgrphd{\noexpand\multicolumn
167             {\the\kvt@@span}
168             {\expandonce\kvt@@extraalign
169             \csexpandonce{\kvt@@colgrp@align@\kvt@@lastgrp}}
170             {\csexpandonce{\kvt@@colgrp@head@\kvt@@lastgrp}}}}%

```

Mark the column group as already used and concluded, such that another use of the same column group can be detected and raise an error.

```
171     \cslet{\kvt@@colgrpdone@\kvt@@lastgrp}{\@ne}}
```

`\kvt@parsehdcolspec` The `\kvt@parsehdcolspec{<tname>}{<cname>}{<config>}{<empty>}\@undefined` macro parses a single header column (resp. column group), `<cname>`. For a column group, `<cname>` can consist of multiple, “+”-separated column names.

```
172 \def\kvt@parsehdcolspec#1#2:#3:#4\@undefined{%
```

First link the individual columns of a column group to the group. In this, ensure that no column is contained in more than one column group.

```

173     \def\kvt@@colreg##1{%
174         \ifinlistcs{##1}{\kvt@colkeys@#1}{-}
175         {\kvt@error{Column `##1' referenced in column group `#2' not known

```

```

176         in table type `#1'}`{Check the \string\NewKeyValTable{#1} for
177         the names of known columns and check `##1' for a typo.}}%
178     \ifcsmacro{kvt@colgrpof##1}
179     {\kvt@error{Column `##1' used in more than one column group}
180     {Check the fourth, optional argument of \string\NewKeyValTable
181     and eliminate multiple occurrences of column `##1'.}}
182     {\csdef{kvt@colgrpof##1}{#2}}%
183 } \kvt@forpsvlist{\kvt@colreg}{#2}%

```

Now parse the *config* of the column, resp. column group.

```

184 \def\kvt@colgrp{#2}%
185 \setkeys[kvt]{ColGroup}{#3}}

```

The following defines the options for header cells.

```

186 \define@key[kvt]{ColGroup}{head}{%
187   \csdef{kvt@colgrp@head@kvt@colgrp}{#1}}
188 \define@key[kvt]{ColGroup}{align}{%
189   \csdef{kvt@colgrp@align@kvt@colgrp}{#1}}
190 \presetkeys[kvt]{ColGroup}{align=c}{%

```

5.4 Row Numbering and Labeling

The following counters simplify row numbering in key-value tables. One can use a table-local counter (`kvtRow`), a table-type local counter (`kvtTypeRow`), and a global counter (`kvtTotalRow`).

- `kvtRow` The `kvtRow` counter can be used by cells to get the current row number. This row number (in contrast to `taburow`) does not count table headers. That is, `kvtRow` provides the current *content* row number, even in tables that are spread over multiple pages.
- ```
191 \newcounter{kvtRow}
```
- `kvtTypeRow` The `kvtTypeRow` counter can be used by cells to get the current row number, including all previous rows of tables of the same type. This counter works together with the `\kvt@rowcount@(<aname>)` macro, which keeps track of the individual row counts of the *<aname>* type.
- ```
192 \newcounter{kvtTypeRow}
```
- `kvtTotalRow` The `kvtTotalRow` counter can be used by cells to get the current row number, including all previous `KeyValTable` tables.
- ```
193 \newcounter{kvtTotalRow}
194 \setcounter{kvtTotalRow}{0}
```
- `\kvtLabel` The `\kvtLabel[<labelopts>]{<counter>}{<label>}` macro sets a label, named *<label>*, for the current value of the L<sup>A</sup>T<sub>E</sub>X counter named *<counter>*.
- ```
195 \newcommand\kvtLabel[3][]{%

```
- The following imitates a `\refstepcounter` in the sense of setting the current label, but it does not touch the *<counter>* (in case someone added some custom hooks to them).
- ```
196 \setcounter{kvt@LabelCtr}{\value{#2}}%
```

```

197 \addtocounter{kvt@LabelCtr}{-1}%
198 \refstepcounter{kvt@LabelCtr}%
Next, define the label (if provided) and show the value of counter.
199 \ifstrempy{#3}{-}{%
200 \ifstrempy{#1}{\label{#3}}{\label{#1}{#3}}}%
201 \csuse{the#2}}

```

`kvt@LabelCtr` The `kvt@LabelCtr` counter is an auxiliary counter for setting labels, used by `\kvtLabel`.

```

202 \newcounter{kvt@LabelCtr}

```

## 5.5 Key-Value Table Content

`KeyValTable` The `KeyValTable` [*options*] [*tname*] environment encloses a new table whose type is identified by the given *tname*. Table options can be overridden by providing *options*.

```

203 \newenvironment{KeyValTable}[2] [] {%
204 \bgroup%

```

`\Row` The `\Row` [*options*] [*content*] macro is made available locally in the `KeyValTable` environment.

```

205 \def\Row{\kvt@AddKeyValRow
206 {\noalign\bgroup}\expandafter\egroup\kvt@row}{#2}}%

207 \kvt@SetOptions{#2}{#1}%
208 \csuse{kvt@StartTable@\cmdkvt@Table@shape}{#2}%
209 }{%
210 \csuse{kvt@EndTable@\cmdkvt@Table@shape}%
211 \egroup}

```

The following saves the row counter value outside the table environment but still in the then-local scope.

```

212 \AfterEndEnvironment{KeyValTable}{%
213 \csdef{kvt@rowcount@\kvt@recenttable}{\thekvtTypeRow}}

```

`\kvt@SetOptions` The `\kvt@SetOptions` [*tname*] [*options*] set the specific table options in the current environment, based on the options for table type *tname* and the specific *options*.

```

214 \newcommand\kvt@SetOptions[2] {%
215 \bgroup\edef\kvt@do{\egroup\noexpand%
216 \setkeys[kvt]{Table}%
217 {\csexpandonce{kvt@options@#1},\unexpanded{#2}}}%

```

### 5.5.1 Table Environment Code

`\kvt@StartTabularlike` The `\kvt@StartTabularlike` [*env*] [*tname*] [*bLong*] [*bTabu*] [*bWidth*] macro begins a table environment for the given table type *tname*. The *env* parameter specifies the concrete environment name. The parameters *bLong*, *bTabu*, and

$\langle bWidth \rangle$  are Boolean parameters (expecting value true or value false). They specify whether the table environment supports multi-page tables ( $\langle bLong \rangle$ ), whether the environment is a `tabu` environment ( $\langle bTabu \rangle$ ), and whether the environment supports specifying the width of the table ( $\langle bWidth \rangle$ ).

```
219 \newcommand\kvt@StartTabularlike[5]{%
```

The `\kvt@@recenttable` allows the `\AfterEndEnvironment` hook for `KeyValTable` to access the most recent table type.

```
220 \gdef\kvt@@recenttable{#2}%
```

```
221 \ifbool{kvt@Table@showrules}
222 {\def\kvt@@rule##1{\csuse{##1rule}}}
223 {\def\kvt@@rule##1{}}%
224 \csuse{kvt@@patchenvend@#1}%
225 \setcounter{kvtRow}{0}%
226 \setcounter{kvtTypeRow}{\csuse{kvt@rowcount@#2}}%
```

In `\kvt@@do`, the start code for the environment, including the header rows, is gathered, with expansion to fill in all the table settings and options.

```
227 \bgroup\edef\kvt@@do{\egroup
228 \ifbool{#4}{\noexpand\kvt@dottedrowcolors
229 {\ifbool{kvt@Table@showhead}
230 {\the\numexpr\csuse{kvt@headrowcount@#2}+1\relax}
231 {1}}%
232 {\expandonce\cmdkvt@Table@rowbg}}%

233 \expandafter\noexpand\csname #1\endcsname
234 \ifbool{#5}
235 {\ifbool{#4}
236 {to \expandonce\cmdkvt@Table@width}
237 {\{\expandonce\cmdkvt@Table@width}\}}
238 }%
239 {\csexpandonce{kvt@alignments@#2}}%
240 \noexpand\kvt@@rule{top}%

241 \ifbool{kvt@Table@showhead}
242 {\csuse{kvt@headings@#2}\noexpand\kvt@@rule{mid}}
243 {}%
244 \ifbool{#4}
245 {\noexpand\taburowcolors 2{\expandonce\cmdkvt@Table@rowbg}}{}}%
246 \ifbool{#3}{\noexpand\endhead}{}}%
247 }\kvt@@do}
```

`\kvt@stepcounters` The `\kvt@stepcounters` [ $\langle delta \rangle$ ] macro increments all row counters by  $\langle delta \rangle$ . If  $\langle delta \rangle$  is omitted,  $\langle delta \rangle=1$ .

```
248 \newcommand\kvt@stepcounters[1][1]{%
249 \addtocounter{kvtRow}{#1}%
250 \addtocounter{kvtTypeRow}{#1}%
251 \addtocounter{kvtTotalRow}{#1}}
```

`\kvt@DefineStdTabEnv` The `\kvt@DefineStdTabEnv` [ $\langle shape \rangle$ ] [ $\langle env \rangle$ ] [ $\langle bLong \rangle$ ] [ $\langle bTabu \rangle$ ] [ $\langle bWidth \rangle$ ] [ $\langle endpatch \rangle$ ] macro defines the macros needed for the given  $\langle shape \rangle$  value. If  $\langle shape \rangle$  is omitted,

$\langle env \rangle$  (the name of the environment to use for the shape) is used as  $\langle shape \rangle$  value. The  $\langle endpatch \rangle$  parameter expects macro code that shall be run at the beginning of the KeyValTable environment to (locally) patch macros related to the end code of  $\langle env \rangle$  for ensuring that the bottom rule,  $\kvt@rule{bottom}$ , is displayed. If  $\langle endpatch \rangle$  is empty, the rule is displayed via  $\kvt@endtable@{shape}$ . Otherwise,  $\kvt@endtable@{shape}$  equals  $\end{env}$ . Environments such as `tabularx` require the latter to parse for the end of the environment. The parameters  $\langle bLong \rangle$ ,  $\langle bTabu \rangle$ , and  $\langle bWidth \rangle$  are the same as for  $\kvt@starttabularlike$ .

Note: In the future, the macro could automatically add  $\langle option \rangle$  to the list of possible values for the shape option.

```

252 \newcommand\kvt@DefineStdTabEnv{\@dblarg\kvt@DefineStdTabEnv@i}
253 \newcommand\kvt@DefineStdTabEnv@i [6] [] {%
254 \expandafter\newcommand\csname kvt@StartTable@#1\endcsname [1] {%
255 \kvt@StartTabularlike{#2}{##1}{#3}{#4}{#5}}%
256 \csedef{kvt@endtable@#1}{%
257 \ifstrempy{#6}{\noexpand\kvt@rule{bottom}}{}}%
258 \expandafter\noexpand\csname end#2\endcsname}%
259 \ifstrempy{#6}{}{\csdef{kvt@patchenvend@#2}{#6}}}
```

The following lines define the macros for the various table shapes / environments.

```

260 \kvt@DefineStdTabEnv{tabular}{false}{false}{false}{}
261 \kvt@DefineStdTabEnv{longtable}{true}{false}{false}{}
262 \kvt@DefineStdTabEnv{tabularx}{false}{false}{true}{%
263 \preto\TX@endtabularx{\toks@ \expandafter{\the\toks@
264 \kvt@rule{bottom}}}}
265 \kvt@DefineStdTabEnv{xltabular}{true}{false}{true}{%
266 \preto\XLT@ii@TX@endtabularx{\toks@ \expandafter{\the\toks@
267 \kvt@rule{bottom}}}}
268 \kvt@DefineStdTabEnv[onepage]{tabu}{false}{true}{true}{}
269 \kvt@DefineStdTabEnv[multipage]{longtabu}{true}{true}{true}{}
```

$\kvt@dottedrowcolors$  The  $\kvt@dottedrowcolors{\langle start-row \rangle}{\langle colors \rangle}$  sets up row colors using the  $\rowcolors$  macro of `xcolor`. The  $\langle colors \rangle$  parameter expects arguments of the form “ $\langle color1 \rangle . . \langle color2 \rangle$ ” (the syntax used for the `rowbg` option. The row colors then alternate between  $\langle color1 \rangle$  and  $\langle color2 \rangle$ , starting with  $\langle color1 \rangle$  in  $\langle start-row \rangle$ . This macro substitutes  $\taburowcolors$  for non-`tabu` environments.

```

270 \newcommand\kvt@dottedrowcolors [2] {%
271 \kvt@dottedrowcolors@i{#1}#2@nil}
272 \def\kvt@dottedrowcolors@i#1#2 . . #3@nil{%
```

Since  $\rowcolors$  expects its color arguments to specify the odd and even color, we swap arguments depending on the parity of  $\langle start-row \rangle$  to ensure  $\langle color1 \rangle$  is applied to  $\langle start-row \rangle$ .

```

273 \ifnumodd{#1}
274 {\rowcolors{#1}{#2}{#3}}
275 {\rowcolors{#1}{#3}{#2}}}
```

## 5.5.2 Environment-Independent Parts

The following block declares the known row options.

```

276 \define@cmdkey[kvt]{Row}{bg}{}%
277 \define@boolkey[kvt]{Row}{hidden}[true]{}%
278 \define@cmdkey[kvt]{Row}{below}{%
279 \define@cmdkey[kvt]{Row}{above}{%
280 \define@cmdkey[kvt]{Row}{around}{%
281 \def\cmdkvt@Row@above{#1}\def\cmdkvt@Row@below{#1}}

```

`\kvt@AddKeyValRow` The `\kvt@AddKeyValRow{<pre>}{<post>}{<tname>}[<options>]{<content>}` macro composes a row for the table of type `<tname>` from the given `<content>` and `<options>`. The `<content>` is a key-value list that specifies the content of the individual cells in the row. The result is returned in macro `\kvt@@row`. The arguments `<pre>` and `<post>` are expanded at the very beginning, resp. end of the macro. They allow to control grouping (`\bgroup` and `\egroup`) as well as table placement via `\noalign`.

```

282 \newcommand\kvt@AddKeyValRow[3]{%
283 #1%

```

It's essential that `<pre>` above comes even before `\@ifnextchar` and, therefore, cannot be moved into `\kvt@AddKeyValRow@i`: The `\@ifnextchar` is not fully expandable and therefore any `\noalign` (in `<pre>`) following `\@ifnextchar` would lead to "misplaced `\noalign`" errors.

```

284 \@ifnextchar[%]
285 {\kvt@AddKeyValRow@i{#2}{#3}}
286 {\kvt@AddKeyValRow@i{#2}{#3}[]}

```

`\kvt@AddKeyValRow@i` The `\kvt@AddKeyValRow@i{<post>}{<tname>}[<options>]{<content>}` macro parses `<options>` and evaluates the hidden option.

```

287 \def\kvt@AddKeyValRow@i#1#2[#3]#4{%
288 \setkeys[kvt]{Row}{#3}%
289 \ifbool{kvt@Row@hidden}
290 {\let\kvt@@row\empty #1}
291 {\kvt@AddKeyValRow@ii{#1}{#2}{#4}}

```

`\kvt@AddKeyValRow@ii` The `\kvt@AddKeyValRow@ii{<post>}{<tname>}{<content>}` macro mainly processes `<content>` as well as `<options>` that have already been parsed by `\kvt@AddKeyValRow@i`.

```

292 \def\kvt@AddKeyValRow@ii#1#2#3{%
293 \setkeys[KeyValTable]{#2}{#3}%

```

Initialize and first add the `\noalign` material to the row.

```

294 \def\kvt@@row{%
295 \ifdefvoid\cmdkvt@Row@above{%
296 \eappto\kvt@@row{\noexpand\noalign{\noexpand\vspace{%
297 \expandonce\cmdkvt@Row@above}}}%
298 \ifdefvoid\cmdkvt@Row@bg{%
299 \eappto\kvt@@row{\noexpand\rowcolor{\expandonce\cmdkvt@Row@bg}}}%

```

Place the `everyrow` hook after `\noalign`.

```

300 \expandafter\appto\expandafter\kvt@@row\expandafter{\kvt@@everyrow}

```

The following loop uses `\do{<cname>}` to append the content of all columns (in the given format and using the given default value), where each column value is

in `\cmdKeyValTable@{tname}@{cname}`. Note that currently the default value is formatted using the given format macro – a design decision.

```
301 \kvt@@span=0\relax
302 \def\do##1{%
```

First recover the cell content (either the specified value for the row or, if no value is specified for the row, the cell’s default value) without formatting.

```
303 \ifcsvoid{cmdKeyValTable@#2@##1}
304 {\letcs\kvt@@cell{kvt@col@default@#2@##1}}
305 {\letcs\kvt@@cell{cmdKeyValTable@#2@##1}}%
```

Separately also already create the formatted content.

```
306 \edef\kvt@@fmtcell{\csexpandonce{kvt@col@format@#2@##1}{%
307 \expandonce\kvt@@cell}}%
```

Next, check whether a column-spanning cell is active (`\kvt@@span > 0`). If this is the case, ensure that if the raw cell content in the current column is empty, then formatting does not make the cell non-empty and, thereby, cause errors with the active column-spanning cell.

```
308 \ifnumgreater\kvt@@span{0}
309 {\advance\kvt@@span\m@ne
310 \ifstrempy\kvt@@cell{\def\kvt@@fmtcell{}}{}}
311 {\appto\kvt@@row{&}}%
```

Now check whether the cell itself spans multiple columns.

```
312 \expandafter\kvt@CheckMulticolumn\kvt@@cell
313 \relax\relax\relax\relax\@undefined{#2}{##1}%
314 \expandafter\appto\expandafter\kvt@@row\expandafter{\kvt@@fmtcell}%
315 }\dolistcsloop{kvt@colkeys@#2}%
```

Finally, add the concluding newline for the row as well as the vertical space after the row, if requested.

```
316 \appto\kvt@@row{\tabularnewline}%
317 \ifdefvoid\cmdkvt@Row@below{}{%
318 \eappto\kvt@@row{\noexpand\noalign{\noexpand\vspace{%
319 \expandonce\cmdkvt@Row@below}}}}%
```

At the very end of the expansion text, put `<post>`.

```
320 #1}
```

`\kvt@everyrow` The `\kvt@everyrow{<code>}` registers `<code>` to be included in the first (invisible) cell of every row.

```
321 \newcommand\kvt@everyrow[1]{\def\kvt@@everyrow{#1}}
322 \newcommand\kvt@@everyrow{}
```

Initialize the hook for every row to increment the row counters.

```
323 \kvt@everyrow{\kvt@stepcounters}%
```

`\kvt@CheckMulticolumn` The `\kvt@CheckMulticolumn{<arg1>}{<arg2>}{<arg3>}{<arg4>}\@undefined{<tname>}{<colname>}` macro checks whether a cell’s initial content (captured by `<arg1>` to `<arg4>`), starts a multi-column cell. If this is the case, the macro records the arguments to `\multicolumn` for use by `\kvt@AddKeyValRow`. In this case,

$\langle arg1 \rangle = \backslash multicolumn$ ,  $\langle arg2 \rangle = \langle n \rangle$  (number of columns to span),  $\langle arg3 \rangle = \langle format \rangle$  (column alignment), and  $\langle arg4 \rangle = \langle item \rangle$  (the content of the cell).

```
324 \def\kvt@CheckMulticolumn#1#2#3#4\@undefined#5#6{%
325 \ifx#1\multicolumn
```

First, record  $\langle n \rangle$  in  $\backslash kvt@@span$ . The subtraction of  $-1$  is already in preparation for the next column, in which one spanning has already been reduced.

```
326 \kvt@@span=#2\relax \advance\kvt@@span\m@ne
```

Second, move the defined cell format to inside of the  $\langle item \rangle$  argument of  $\backslash multicolumn$  rather than around the  $\backslash multicolumn$ .

```
327 \edef\kvt@@fmtcell{\unexpanded{\multicolumn{#2}{#3}}%
328 {\csexpandonce{\kvt@col@format@#5#6}{\expandonce{#4}}}%
329 \fi}
```

## 5.6 Collecting Key-Value Table Content

$\backslash ShowKeyValTable$  The  $\backslash ShowKeyValTable[\langle options \rangle]{\langle tname \rangle}$  macro shows a table of type  $\langle tname \rangle$  with given  $\langle options \rangle$ . The rows must have been collected using  $\backslash Row$  in  $KeyValTableContent$  environments or using  $\backslash AddKeyValRow$ .

```
330 \newcommand\ShowKeyValTable[2][]{%
331 \begin{KeyValTable}[#1]{#2}%
332 \csuse{kvt@rows@#2}%
333 \end{KeyValTable}%
334 \csdef{kvt@rows@#2}{}}
```

$\backslash AddKeyValRow$  The  $\backslash AddKeyValRow\{\langle tname \rangle\}[\langle options \rangle]{\langle content \rangle}$  adds a row with a given  $\langle content \rangle$  to the existing content for the next table of type  $\langle tname \rangle$  that is displayed with  $\backslash ShowKeyValTable$ . The  $\langle content \rangle$  and  $\langle options \rangle$  parameters are the same as with  $\backslash kvt@AddKeyValRow$ . The resulting row ( $\backslash kvt@@row$ ) is globally appended to  $\backslash kvt@rows@{\langle tname \rangle}$ .

```
335 \newcommand\AddKeyValRow[1]{%
336 \kvt@AddKeyValRow
337 {\bgroup}
338 {\csxappto{kvt@rows@#1}{\expandonce{\kvt@@row}}\egroup}
339 {#1}}
```

$KeyValTableContent$  The  $KeyValTableContent\{\langle tname \rangle\}$  environment acts as a container in which rows can be specified without automatically being displayed. In this environment, rows can be specified via the  $\backslash Row\{\langle content \rangle\}$  macro, which is supposedly shorter than using  $\backslash AddKeyValRow\langle tname \rangle\langle content \rangle$ .

```
340 \newenvironment{KeyValTableContent}[1]{%
341 \def\Row{\AddKeyValRow{#1}}{}}
```

## 5.7 Package Options

The `tabu` is used by default for typesetting the tables, additionally with `longtable` for tables that can span multiple pages. If the default packages are never used or the `tabu` package shall be loaded manually, the `noTabuPkg` option can be used.

```
342 \define@boolkey[kvt]{PackageOptions}[kvt@@]{noTabuPkg}[true]{}
```

Next, set default package options and process them.

```
343 \ExecuteOptionsX[kvt]<PackageOptions>{%
344 noTabuPkg=false,
345 }
346 \ProcessOptionsX[kvt]<PackageOptions>\relax
```

Finally, implement the outcome of the options parsing.

```
347 \ifbool{kvt@noTabuPkg}{}{%
348 \RequirePackage{longtable,tabu}}
```

## 5.8 Auxiliary Code

`\kvt@dossvlist` The `\kvt@dossvlist{<list>}` macro parses a semicolon-separated list and runs `\do{item}` for every element of the list.

```
349 \DeclareListParser{\kvt@dossvlist}{;}
```

`\kvt@forpsvlist` The `\kvt@forpsvlist{<handler>}{<list>}` parses a ‘+’-separated list.

```
350 \DeclareListParser*{\kvt@forpsvlist}{+}
```

`\kvt@dobrclist` The `\kvt@dobrclist{<list>}` parses a ‘\’-separated list.

```
351 \DeclareListParser{\kvt@dobrclist}{\}
```

`\kvt@error`

`\kvt@warn`

```
352 \newcommand\kvt@error[2]{\PackageError{keyvaltable}{#1}{#2}}
353 \newcommand\kvt@warn[1]{\PackageWarning{keyvaltable}{#1}}
```

## Change History
