

NAME

dosepsbin -- Extract PS/WMF/TIFF sections from DOS EPS binary files

VERSION

2012-03-22 v1.2

SYNOPSIS

The program **dosepsbin** analyses an EPS file that is not a plain ASCII PostScript file but given as DOS EPS binary file.

```
dosepsbin [options] <input file>
```

First it analyzes the *input file*, validates its header and summarizes the available sections. Depending on the given options, the sections are then written to files.

Options:

```
--eps-file <file>      Write PS section to <file>.
--wmf-file <file>      Write WMF section to <file>.
--tiff-file <file>      Write TIFF section to <file>.
--inputfile <file>     The name of the input file.
--verbose              Verbose output.
--quiet               Only errors and warnings are printed.
--help               Brief help message.
--man                Full documentation.
--version            Print version identification.
```

The files for output must be different from the input file.

DESCRIPTION**DOS EPS Binary File Format**

A Encapsulated PostScript (EPS) file can also be given in a special binary format to support the inclusion of a thumbnail. The file format starts with a binary header that contains the positions of the possible sections:

- * Postscript (PS)
- * Windows Metafile Format (WMF)
- * Tag Image File Format (TIFF)

The PS section must be present and either the WMF file or the TIFF file should be given.

OPTIONS

--eps-file=<file>

The PS section is written to *<file>*. The output file must be different from the input file.

--wmf-file=<file>

The WMF section is written to *<file>* if present. The output file must be different from the input file.

--tiff-file=<file>

The TIFF section is written to *<file>* if present. The output file must be different from the input file.

---inputfile=<file>

The input file can also be given directly on the command line. If the file does not exist, then the file with extension '.eps' is tried.

- verbose**
Verbose messages.
- quiet**
No messages are printed except for errors and warnings.
- help**
Display help screen.
- man**
Prints manual page.
- version**
Print version identification and exit.

EXAMPLES

The following command extracts the PS section from file *test.eps* and stores the result in file *test-ps.eps*:

```
dosepsbin --eps-file test-ps.eps test.eps
```

HISTORY

2011/11/10 v1.0

- * First version.

2011/12/05 v1.1

- * Typo fixed in help text (thanks Peter Breitenlohner).

2012/03/22 v1.2

- * Fix in validation test for offset of PS section.
